

Process Oriented Data Science

UNIVERSITAT POLITÈCNICA
DE CATALUNYA
BARCELONATECH

Campus d'Excel·lència Internacional

Josep Carmona
Computer Science Department

- **M1: Process Mining Overview, Positioning & Preliminaries (Event data & Process Models)**
- M2: Process Discovery
- M3: Conformance Checking
- M4: Process Enhancement

- Most of the material of this course is taken from my colleagues:
 - RWTH Aachen (Prof. Wil van der Aalst)
 - Humboldt University zu Berlin (Prof. Matthias Weidlich)
 - **Technische Universiteit Eindhoven (Prof. Boudewijn van Dongen)**
 - University of Tartu (Prof. Marlon Dumas)
 - University of Melbourne (Prof. Marcello La Rosa)
 - Technical University of Denmark (Prof. Andrea Burattin)
- Hence, this material is only provided for your learning, please do not share nor publish

Dynamic Systems: discrete vs continuous

Discrete

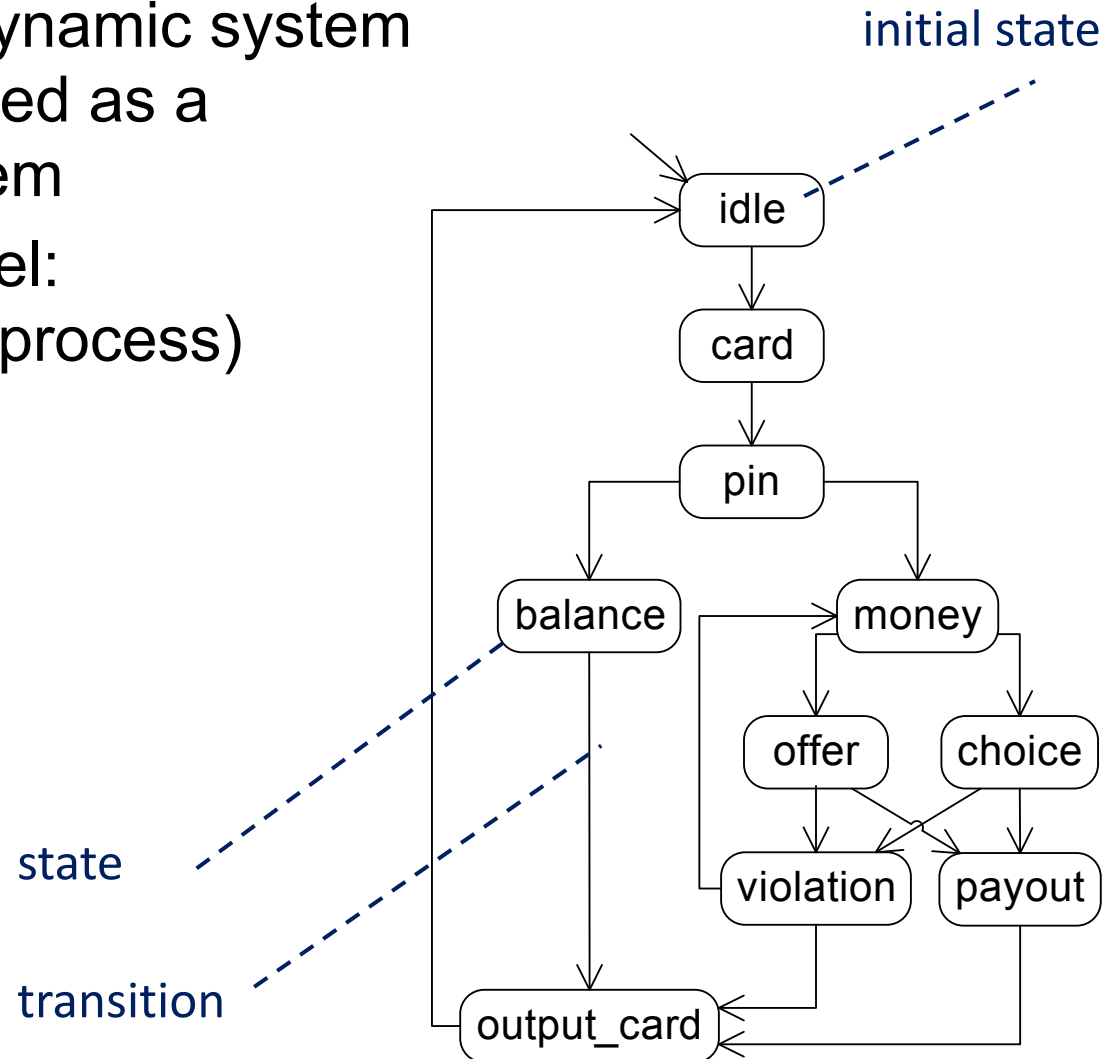

Continuous

Transition Systems

- Any discrete dynamic system can be described as a transition system
- Low level model: "Mother of all (process) models"

Example system: IEEE1394 (Firewire)

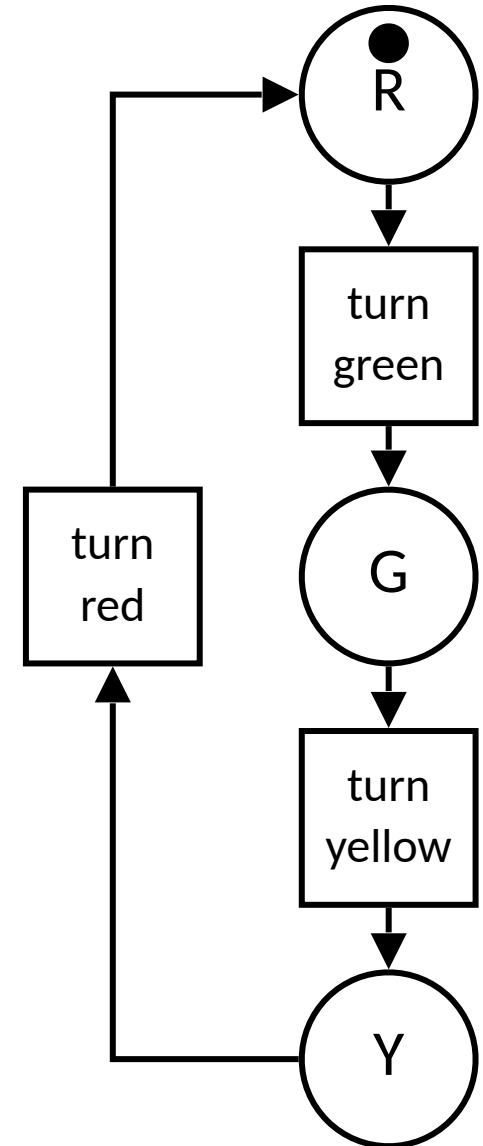

- Commucation between two nodes over a bus
- 25000 states
- Possible deadlocks!

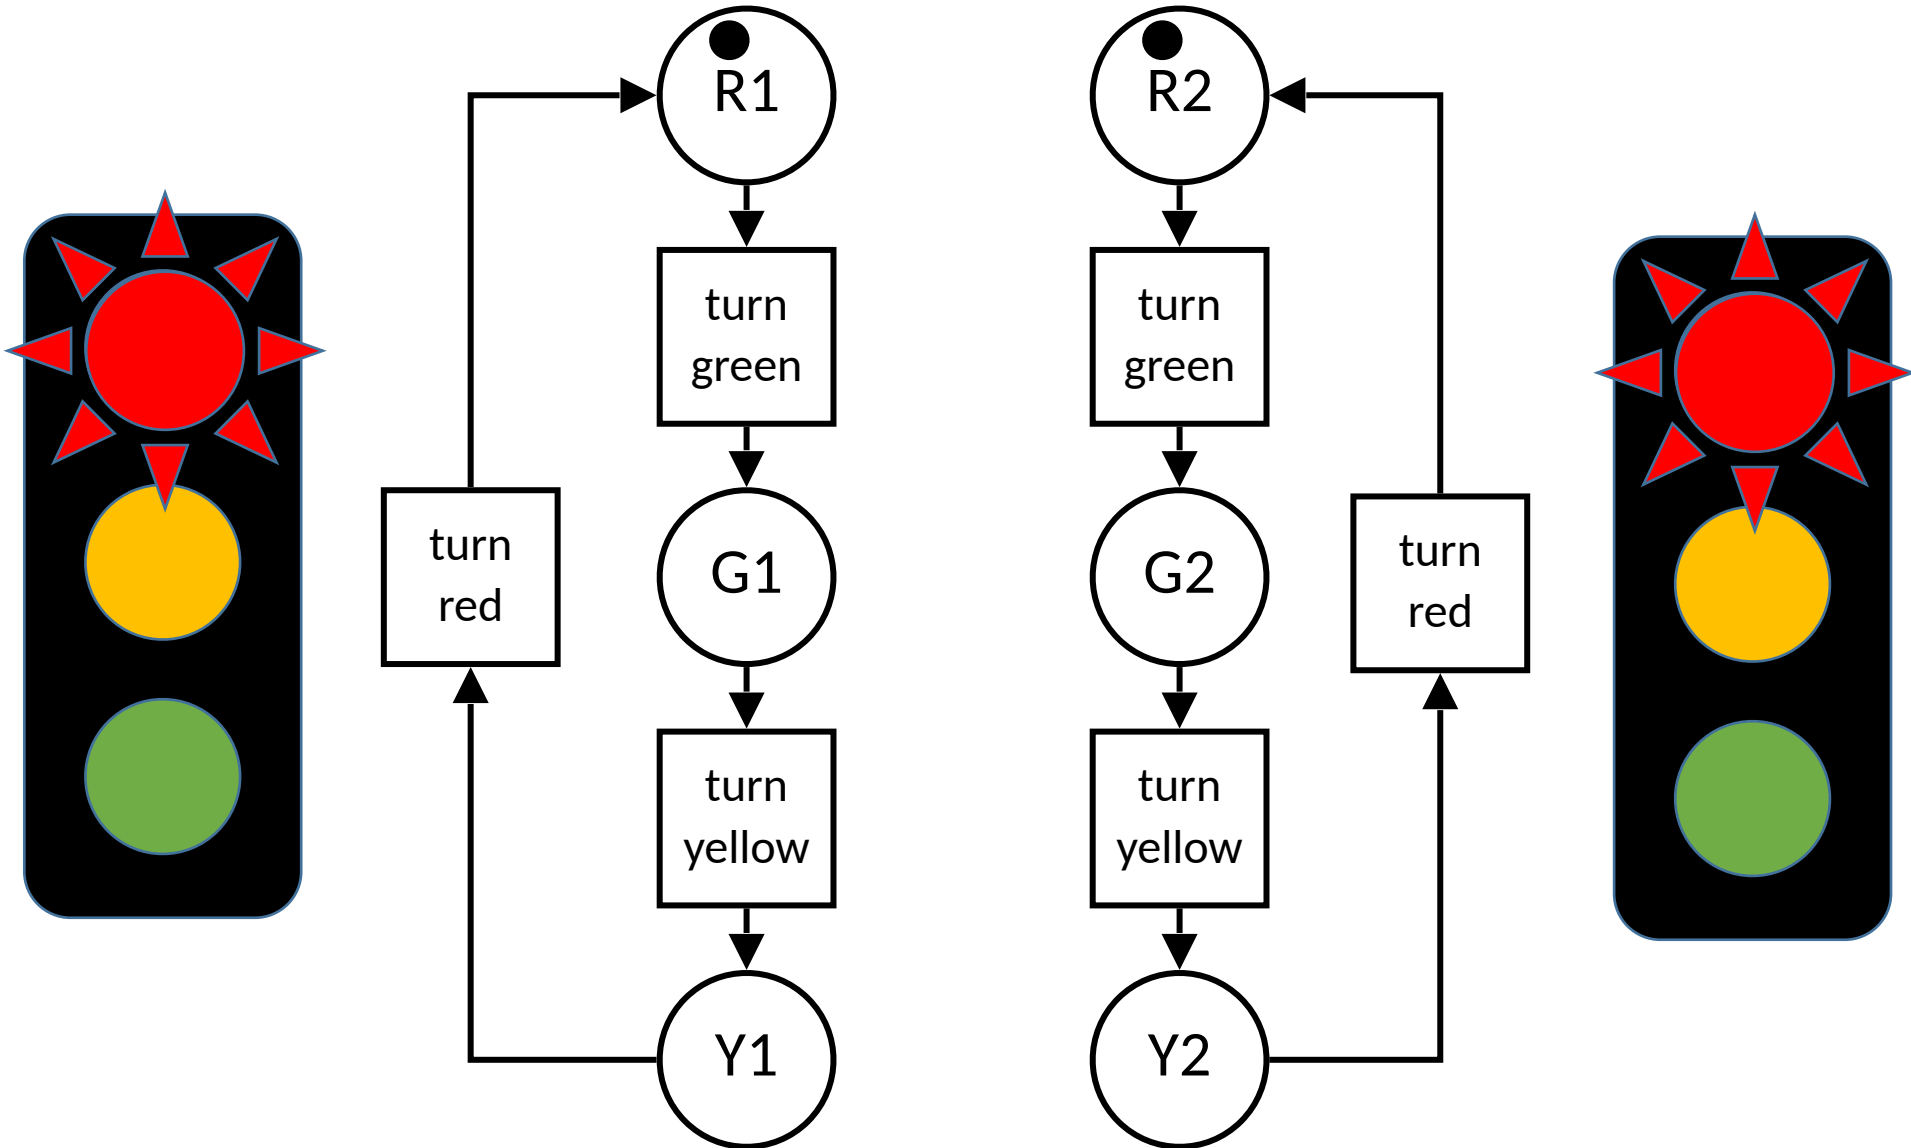

Petri nets provide a compact way to describe (potentially infinite) transition systems as a directed graph consisting of places and transitions, where:

- Transitions are represented as boxes
- Places are represented as circles
- Places can contain 0 or more tokens
- The states of a transition system is defined as the distribution of tokens over places
- The Firing Rule governs the state changes

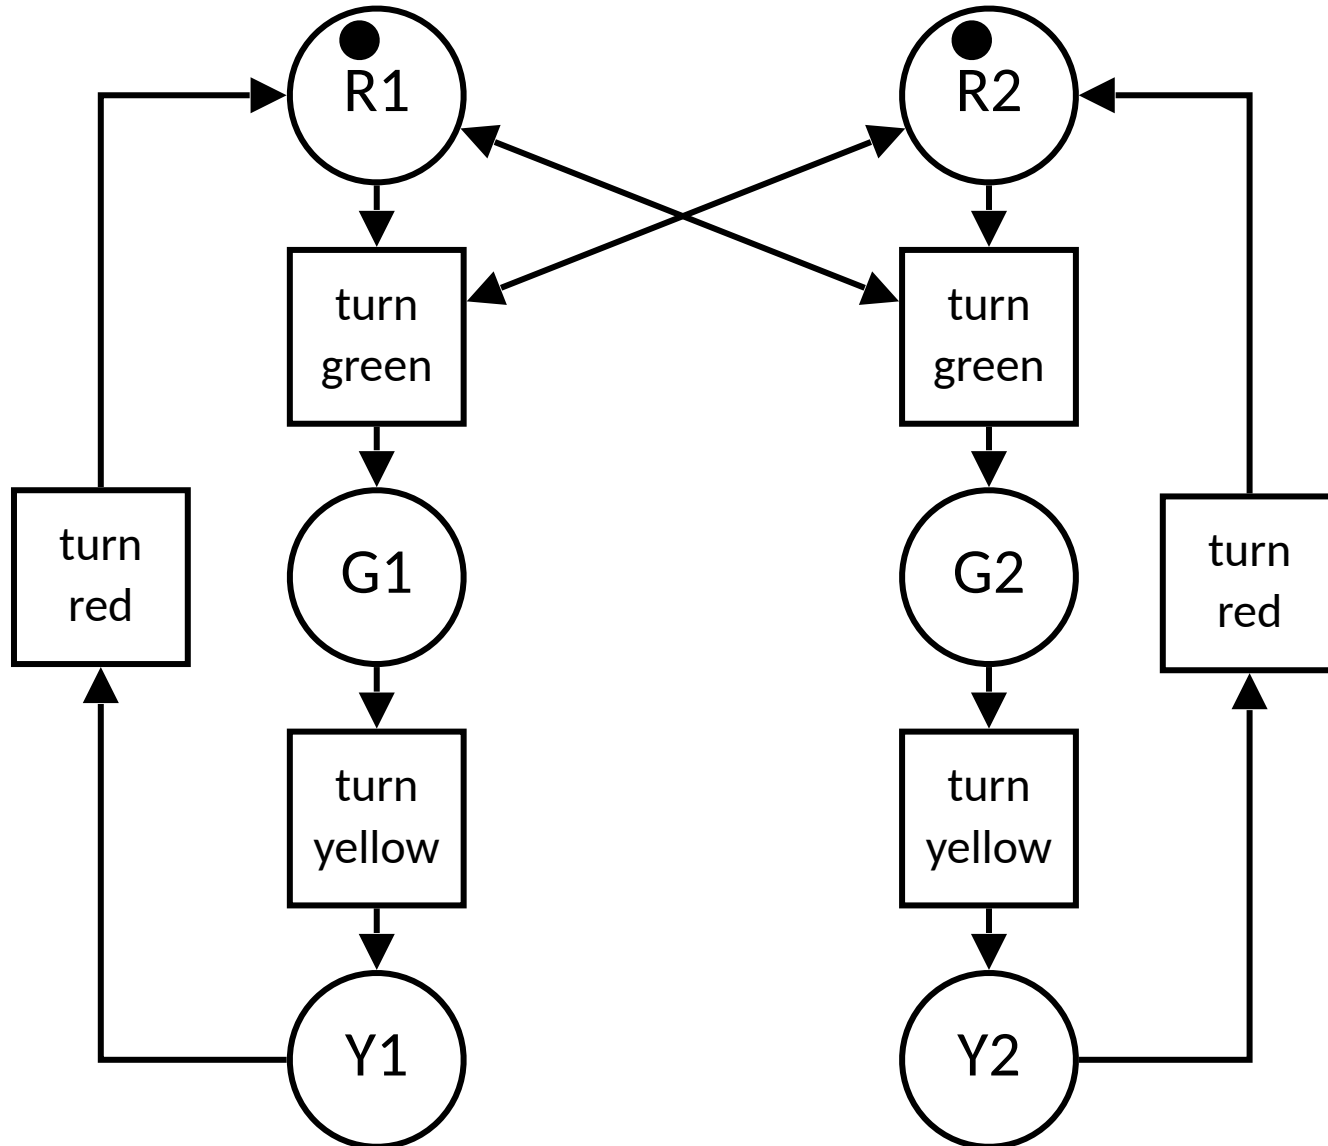

Example: Single traffic light

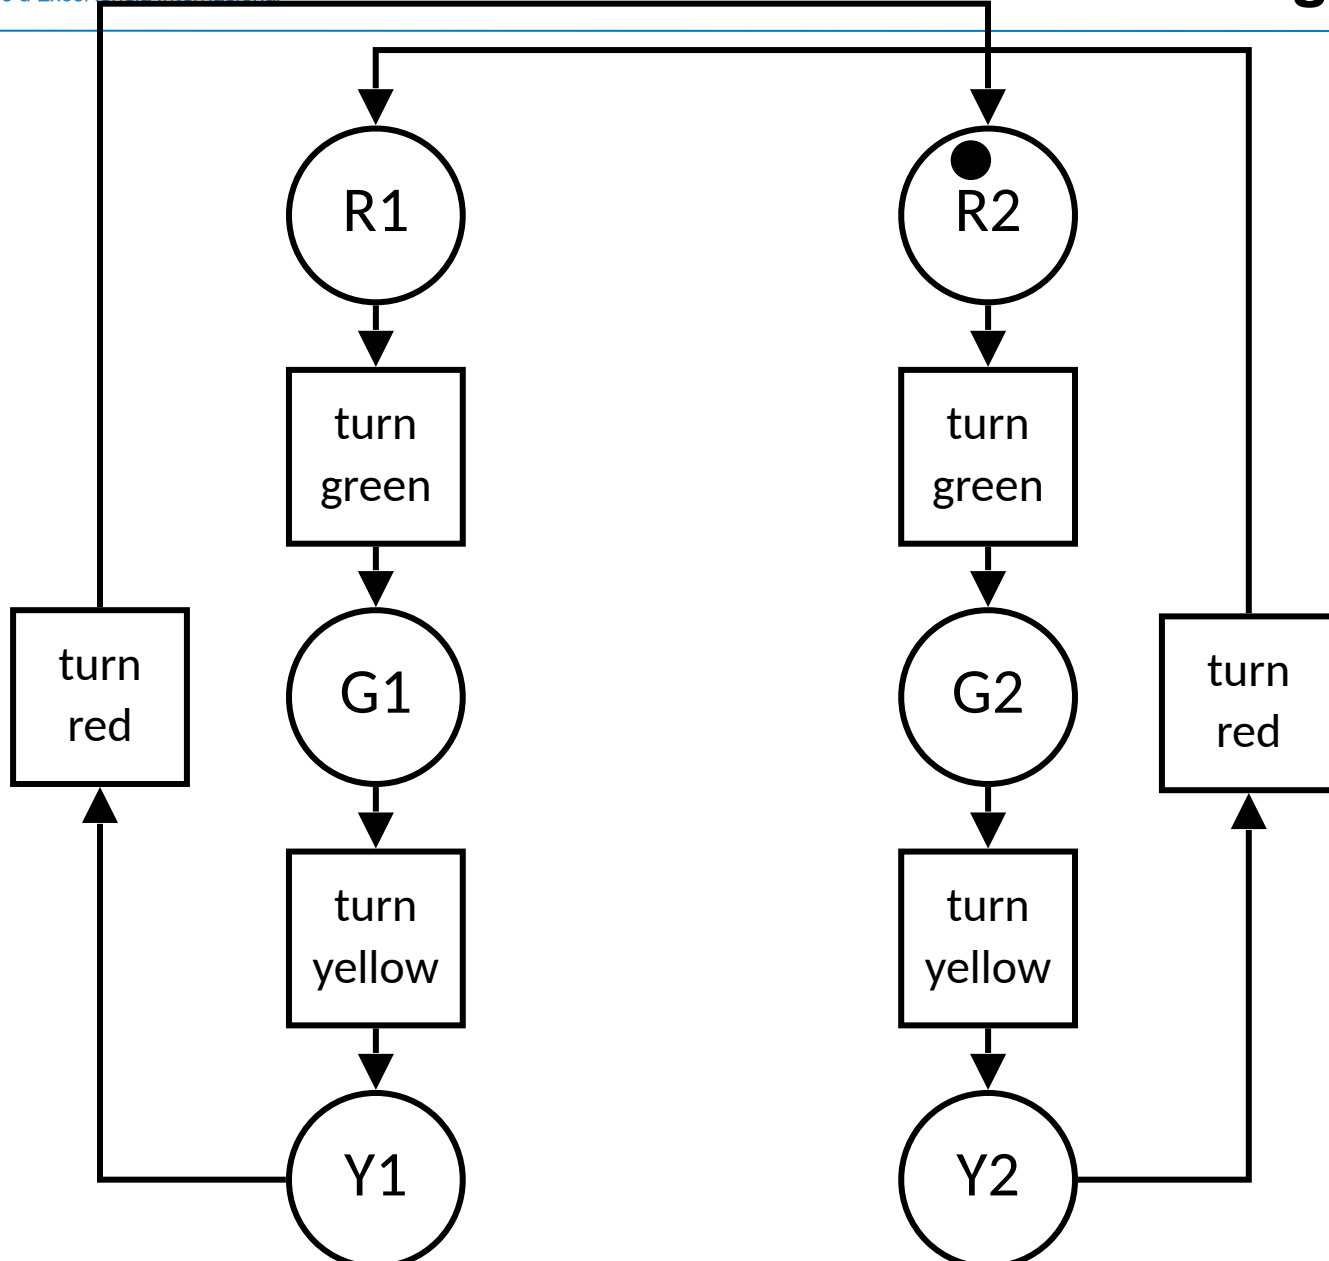

Example: Two traffic lights

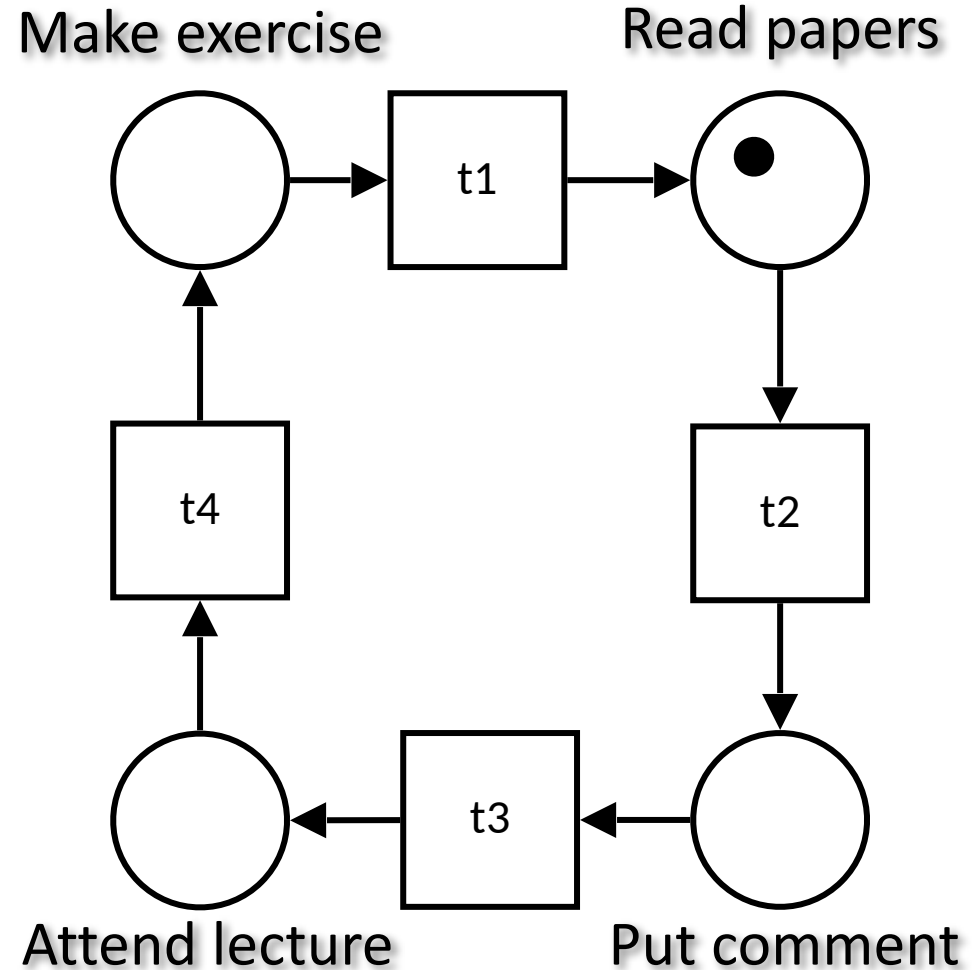

Example: Two traffic lights

Example: Two traffic lights

A model is an *abstraction* of reality

Many systems can be modelled the same way!

It's important that models are correct!

Why Petri nets

The “Business Process Modelling ” chaos: Several tools with different process languages

Business process modeling tools

Protos ARIS BPM|one IBM WebSphere

Model-based analysis tools

Simula Arena IBM WebSphere ProM Wofla CPN IDE

Business process enactment tools

BPM|one SAP ERP Oracle's JD Edwards IBM WebSphere

Tools for analyzing running business process

YAWL

IDEF/DFD diagrams

BPEL

Event-driven Process Chains
(EPCs)

UML activity diagrams

...

What's the next
notation?

Why Petri Nets ?

And not the most used notation in industry ...

- All industrial languages/tools tend to come and go.
- Focus would be on syntactical elements rather than basic concepts.
- Often no formal semantics.
- Only few analysis techniques available.

Goal:

- Teach **foundational concepts** of process modeling and analysis.

Compactness

Concurrency, locality

Tool support

A Petri net is a triple (P, T, F) , where

- P is a finite set of places,
- T is a finite set of transitions,
- $F \subseteq (P \times T) \cup (T \times P)$ is a flow relation.

Any diagram can be mapped onto such a triple and vice versa.

$$P = \{p_1, p_2, p_3\}$$

$$T = \{t\}$$

$$F = \{(p_1, t), (p_2, t), (t, p_3)\}$$

Petri Nets: Preset and Postset

Intuition: Define input and output places in terms of the flow relation.
Let t be a transition.

- Set $\bullet t = \{p \mid (p, t) \in F\}$ defines all input places of t (the preset of t)
- Set $t\bullet = \{p \mid (t, p) \in F\}$ defines all output places of t (the postset of t)

In a Petri net (P, T, F) , a transition $t \in T$ is enabled at marking $m: P \rightarrow \mathbb{N}$ if for all $p \in \bullet t$, $m(p) > 0$.

t is enabled at marking m

Petri Nets: Firing Rule

- For a Petri net (P, T, F) , firing transition $t \in T$ at a marking m_1 leads to a new marking m_2 such that for any $p \in P$

- $m_2(p) = m_1(p) - 1$ if $p \in \bullet t \setminus t \bullet$
- $m_2(p) = m_1(p) + 1$ if $p \in t \bullet \setminus \bullet t$
- $m_2(p) = m_1(p)$ otherwise

$$m_1 = [p_1, p_2^2]$$

firing t yields:

$$m_2(p_1) = m_1(p_1) - 1$$

$$m_2(p_2) = m_1(p_2) - 1$$

$$m_2(p_3) = m_1(p_3) + 1$$

$$m_2 = [p_2, p_3]$$

What's a process ?

Any time two or more activities are performed in the context of a case, fundamental principles of processes apply (e.g. Petri net theory)

Activities in processes are related. They have a logical order in which they have to be executed.

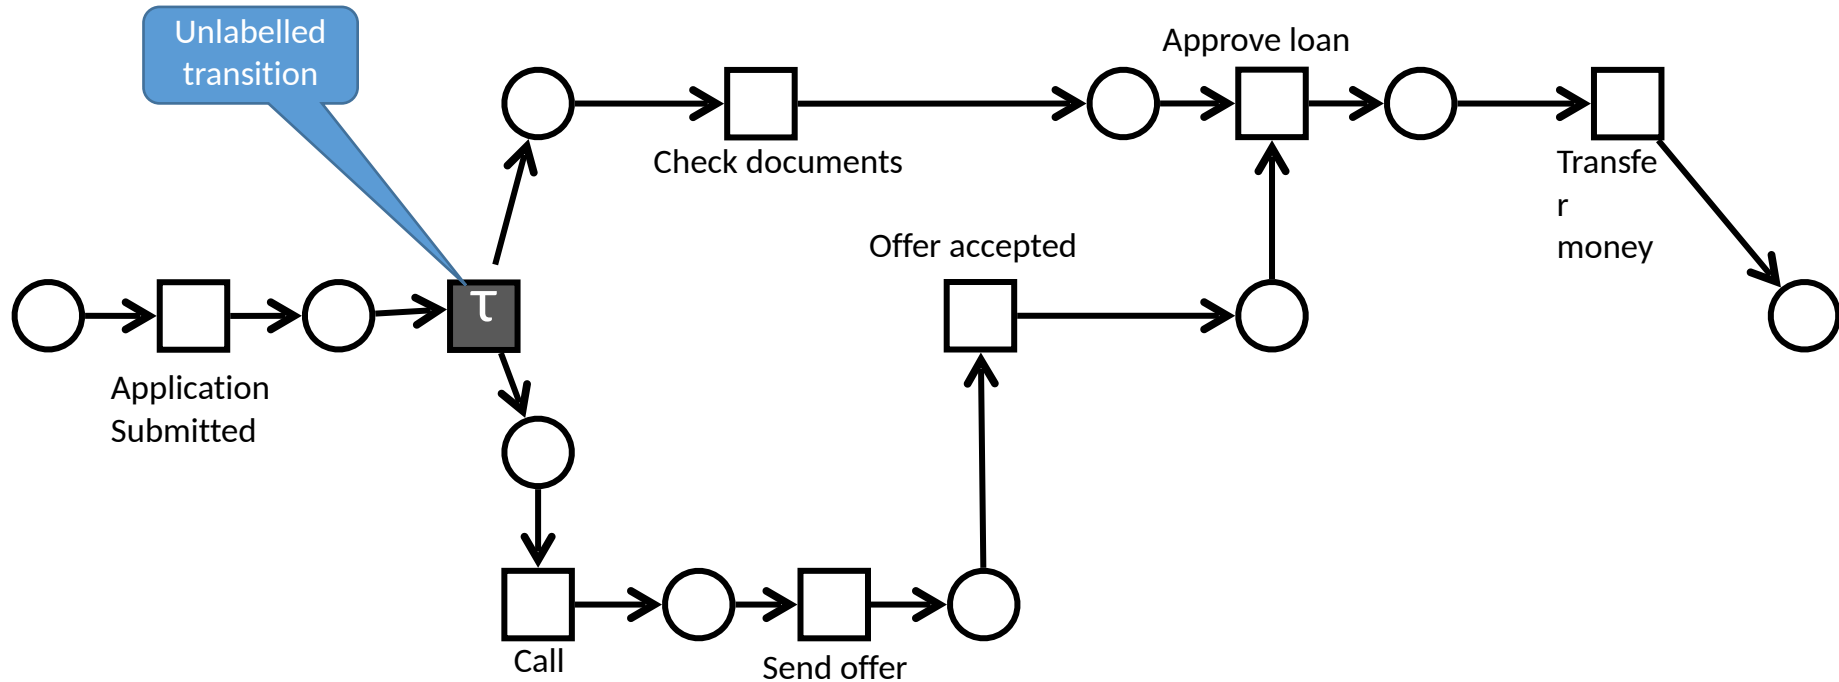

Cases are the 'objects' in a process that change over time. For example an insurance claim, an offence registration or a loan application

Example: BPI 2012 (simplified to fit slides)

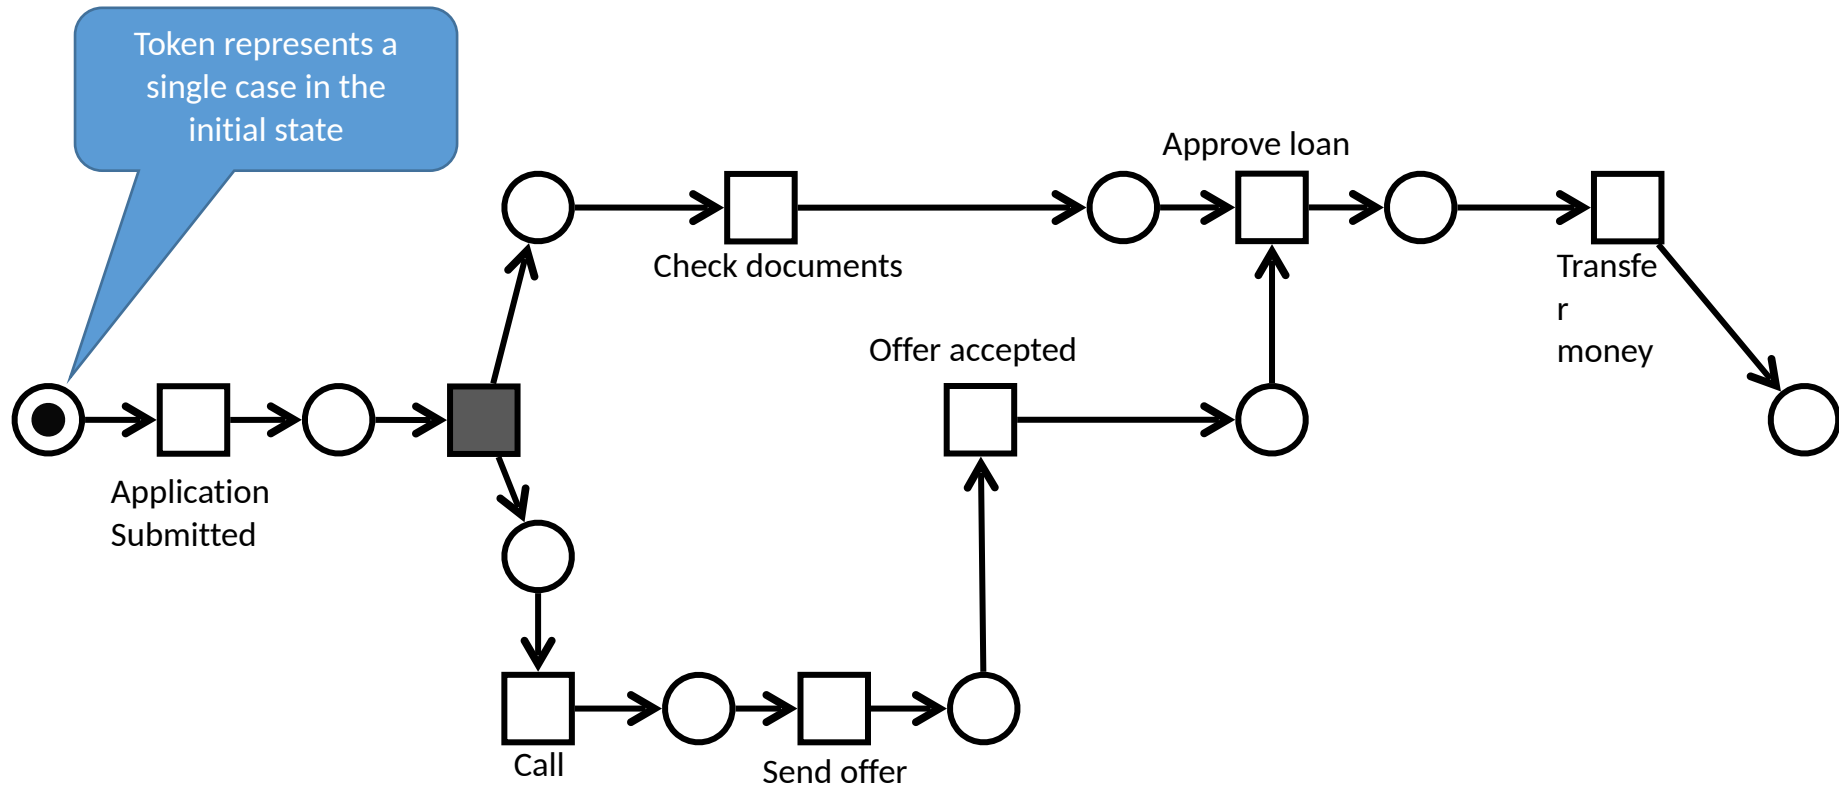

Process description from the company's website:

- *The nice thing about taking a loan from us is that you can arrange everything online. A call agent will then contact you to go through your application, to judge the application and to send you an offer for signing.*
- *After your approval of the offer and a final check by our customer center if all submitted documents are correct, we transfer the money to your account.*

Example: BPI 2012 (simplified to fit slides)

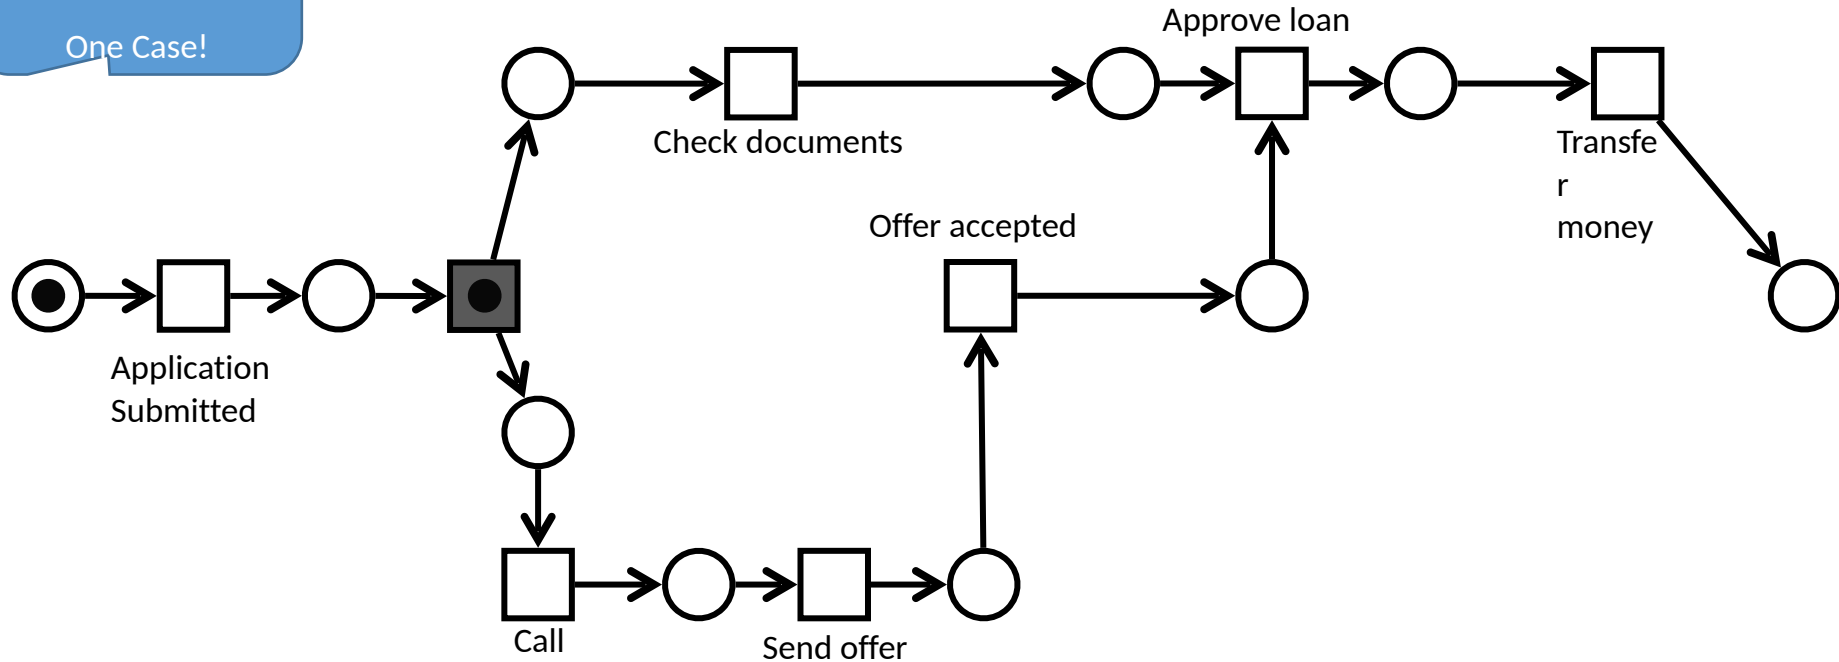

Example: BPI 2012 (simplified to fit slides)

Example: BPI 2012 (simplified to fit slides)

Happy-flow
execution of this
process:

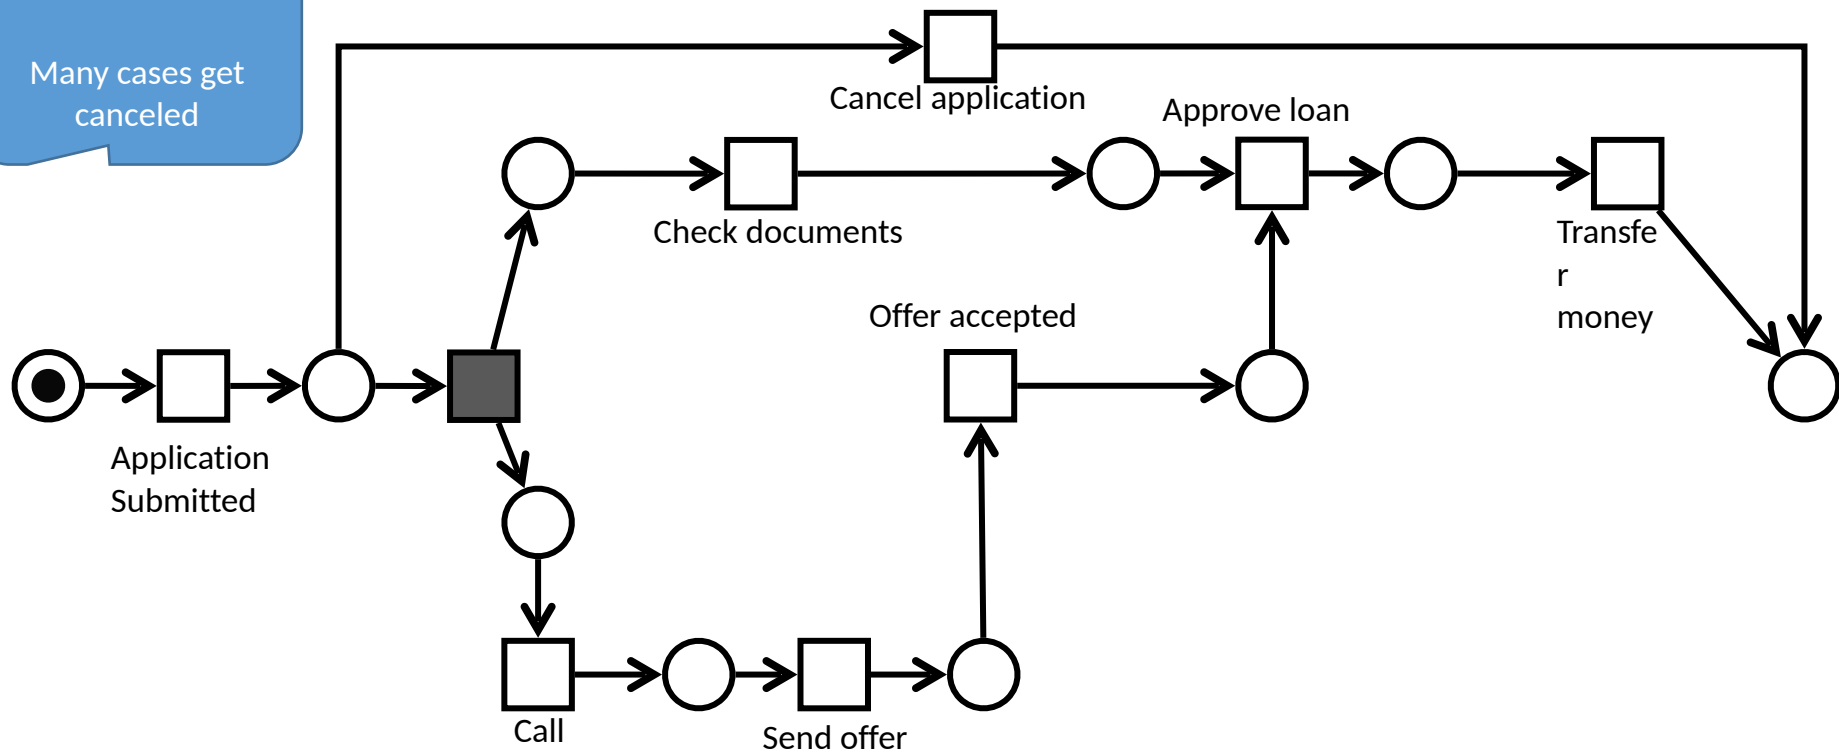

One Case!

Example: BPI 2012 (simplified to fit slides)

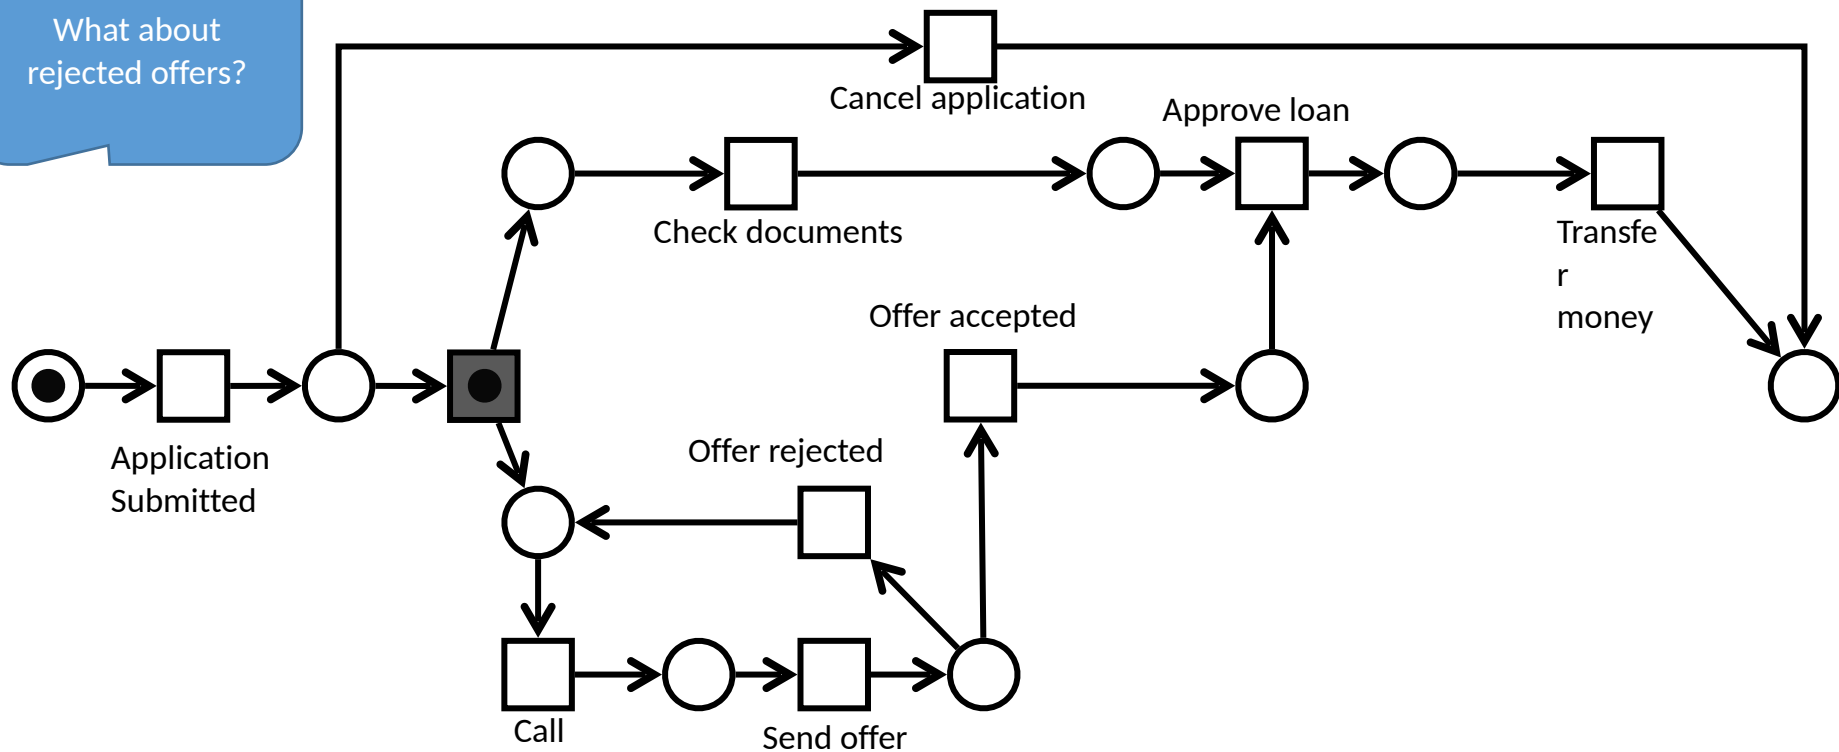

Data shows:

Many cases get canceled

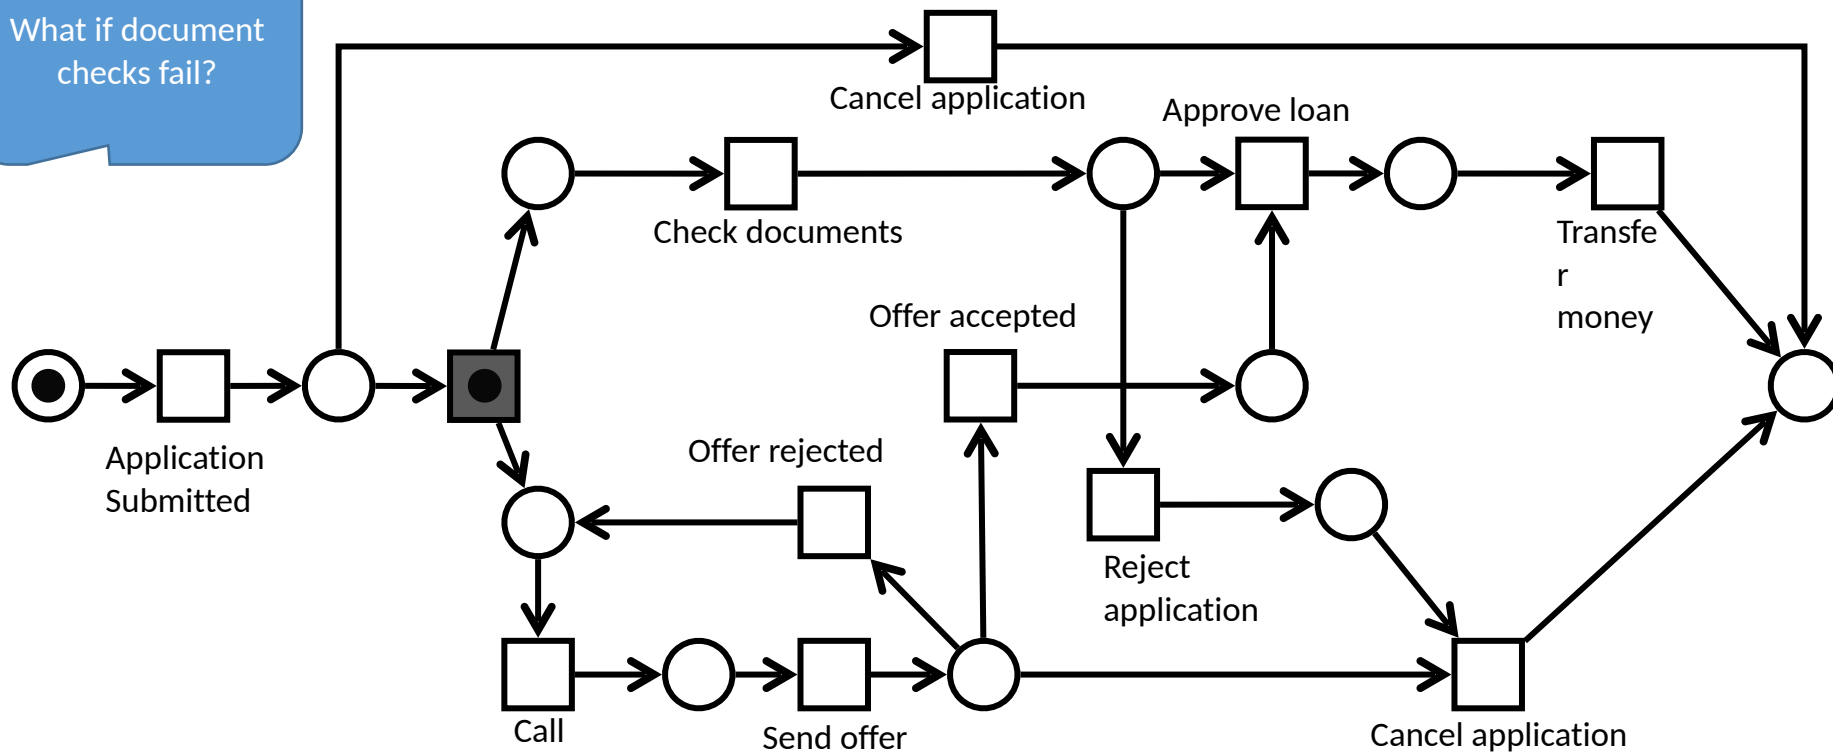

Example: BPI 2012 (simplified to fit slides)

What about
rejected offers?

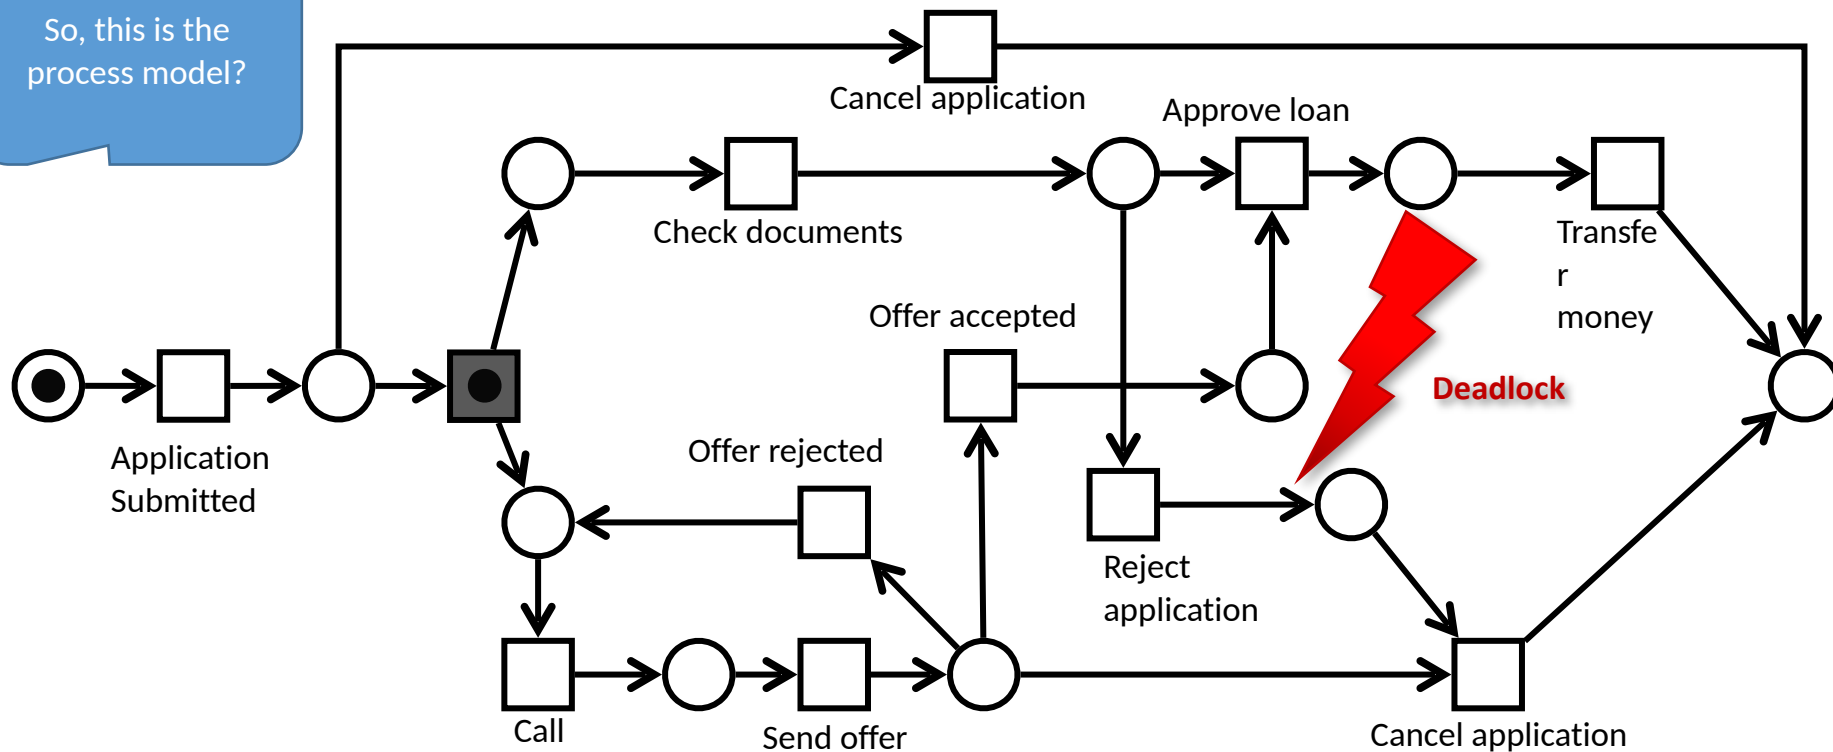

**Example:
BPI 2012 (simplified to fit slides)**

What if document checks fail?

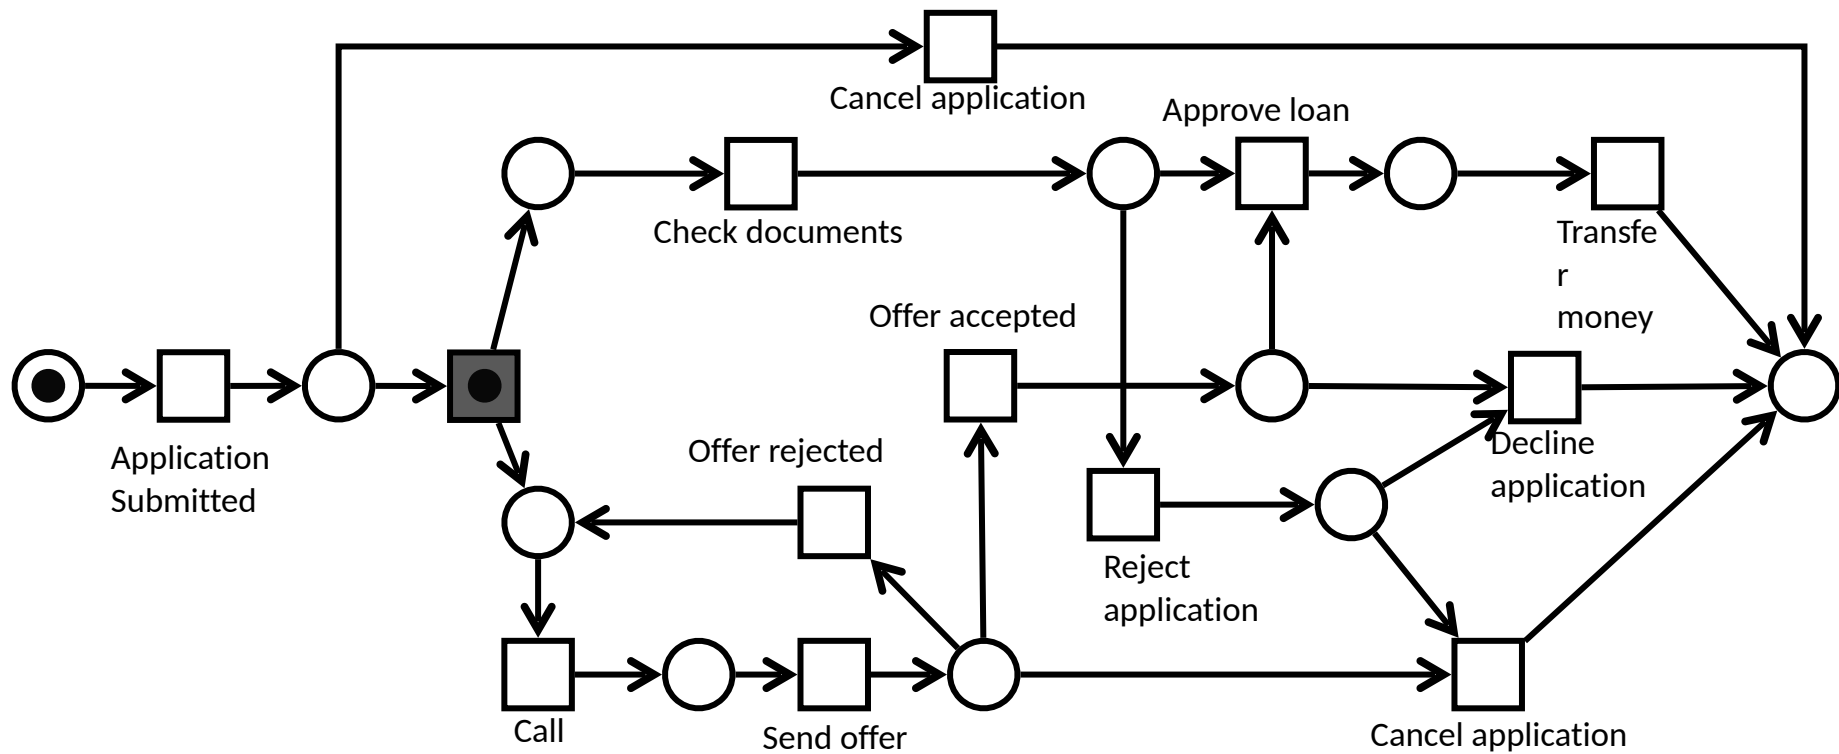

Example: BPI 2012 (simplified to fit slides)

So, this is the
process model?

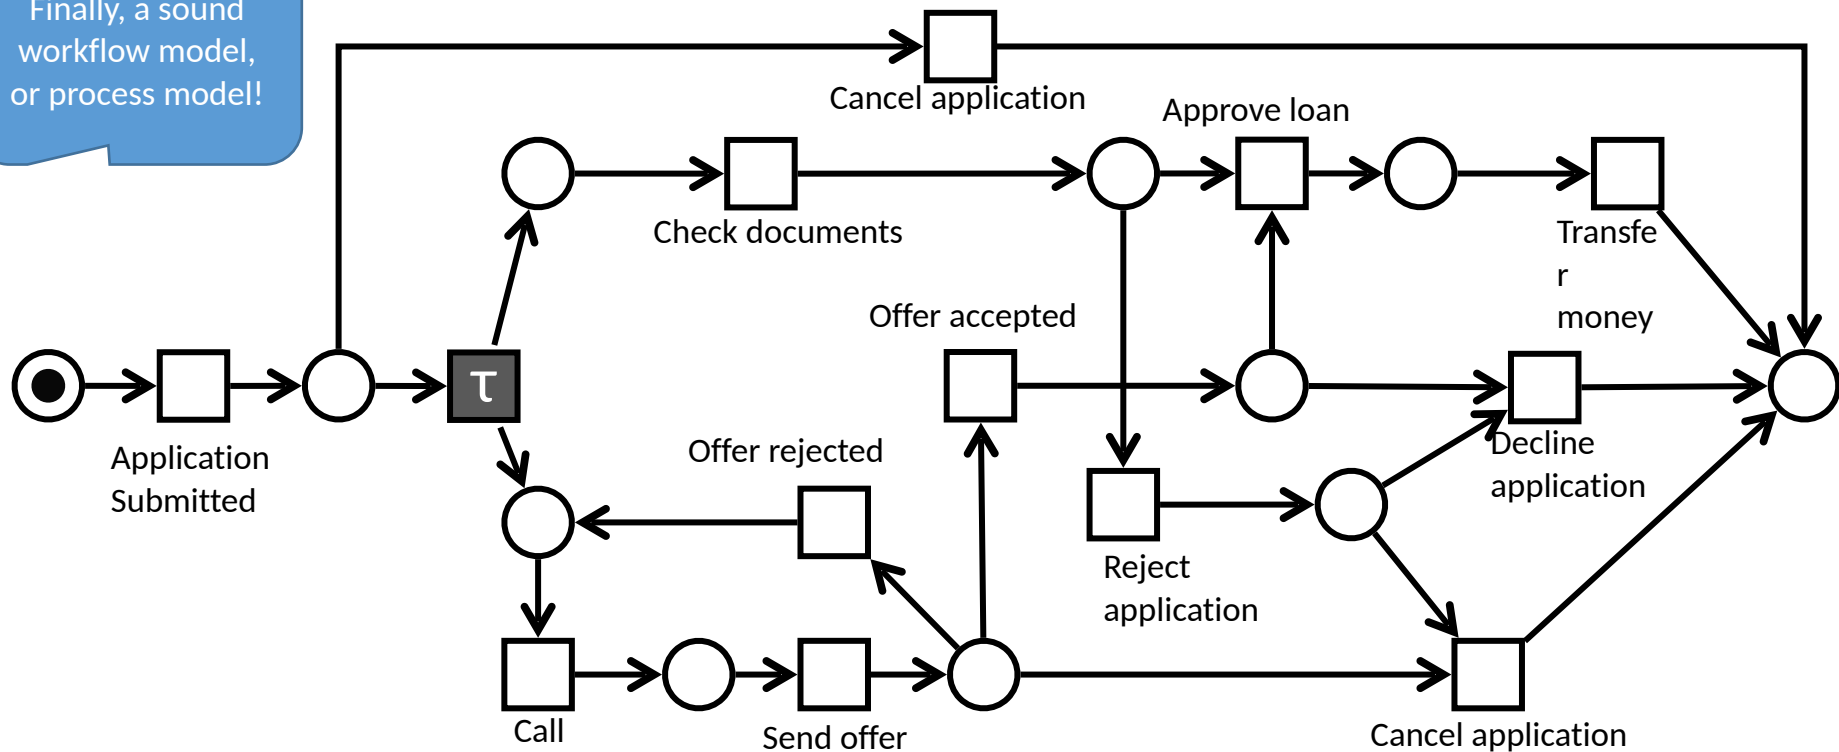

**Example:
BPI 2012 (simplified to fit slides)**

Example: BPI 2012 (simplified to fit slides)

Finally, a sound
workflow model,
or process model!

Process Models vs. Petri Nets

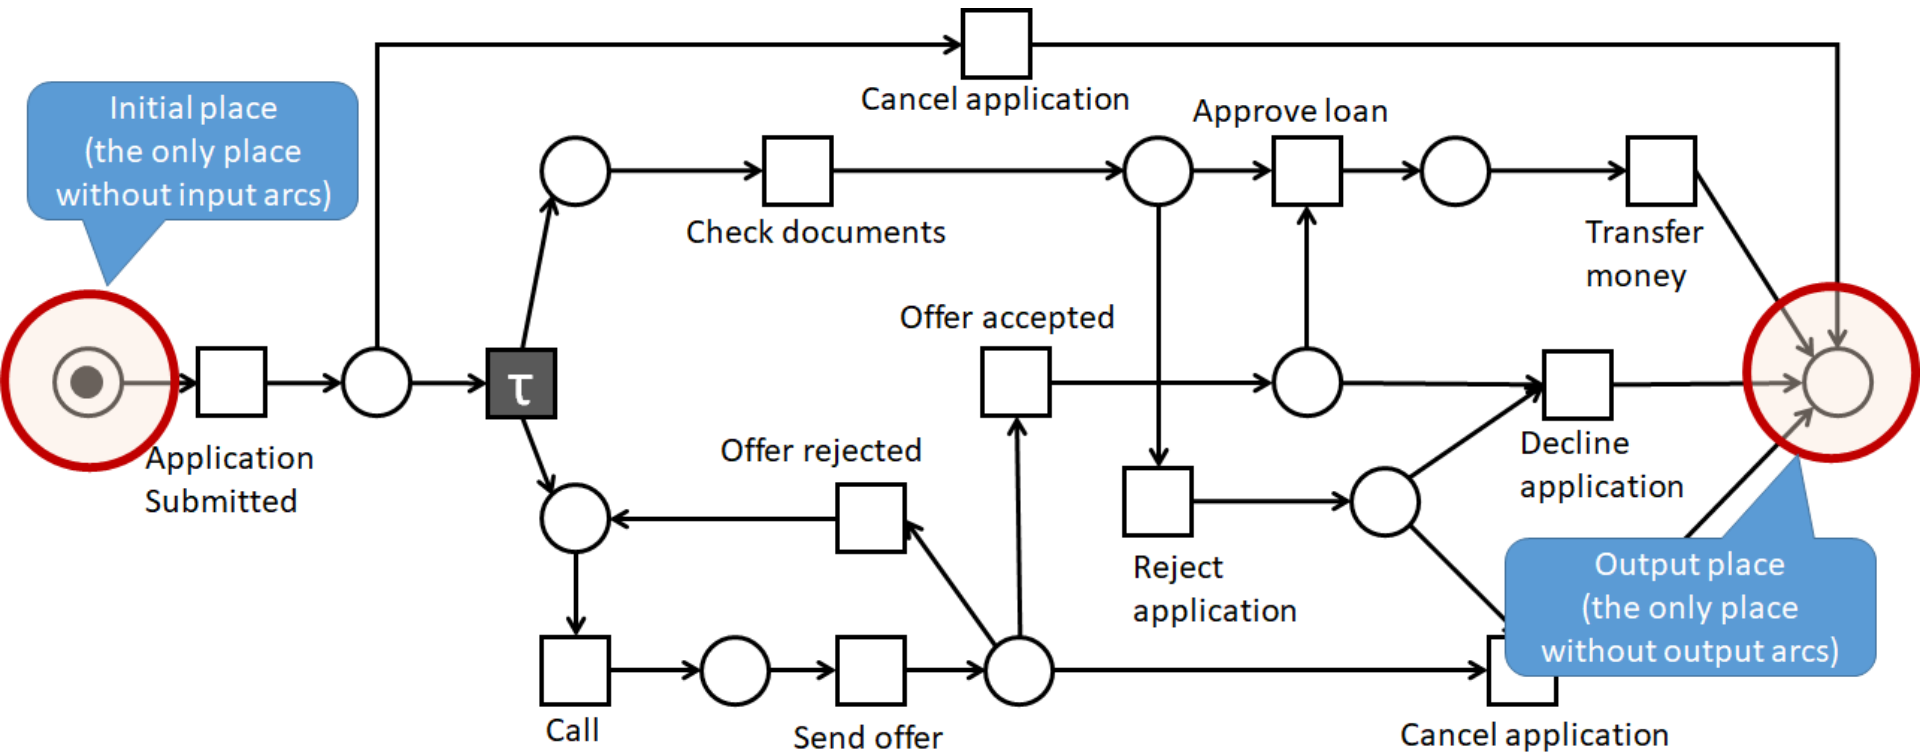

Process

- Activity by resource
- Decision by environment
- Process Model
- Case
- State of a case

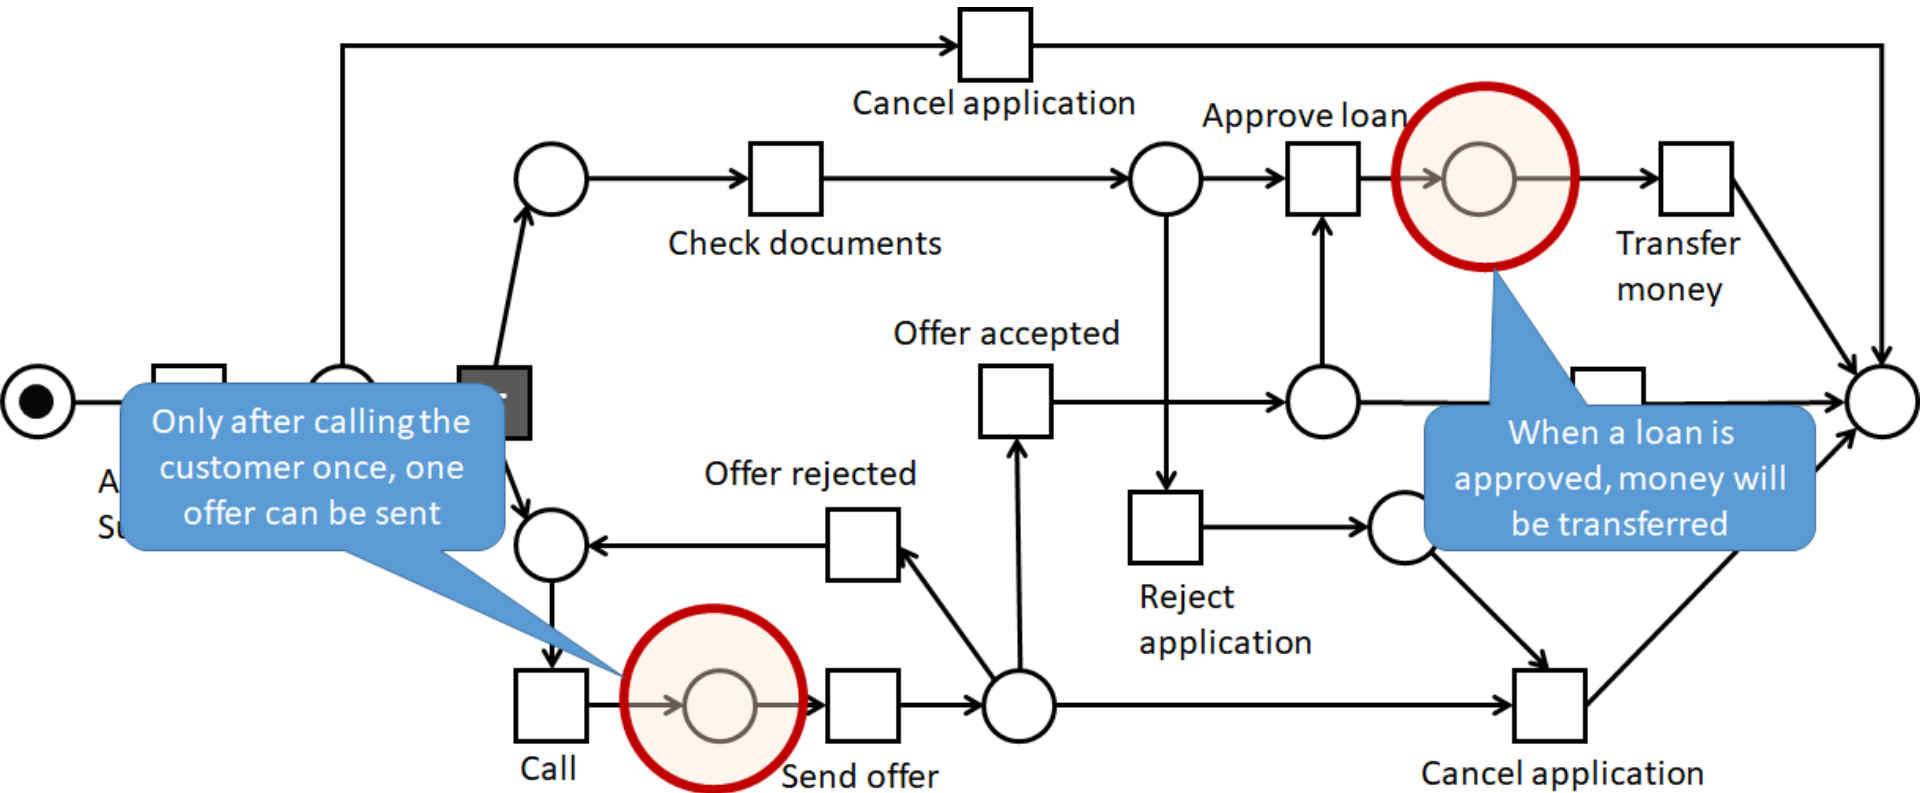

Petri net

- Transition (-label, typically present tense)
- Transition (-label, typically past tense)
- Petri net explaining the flow of each case
- Token(s) in the net
- Marking of the Petri net

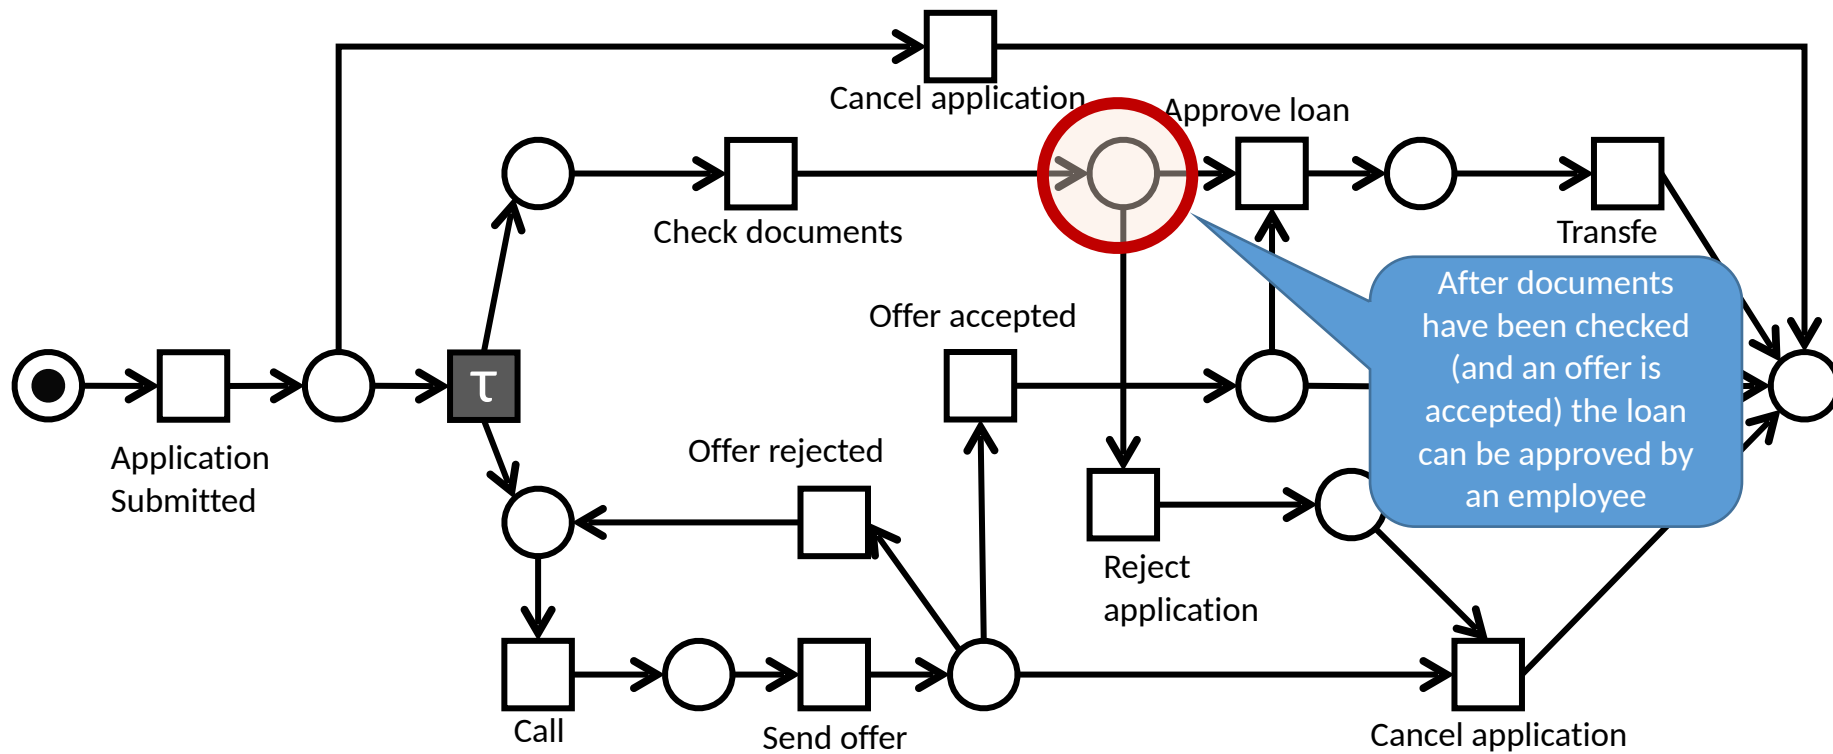

Process: Proper begin and end

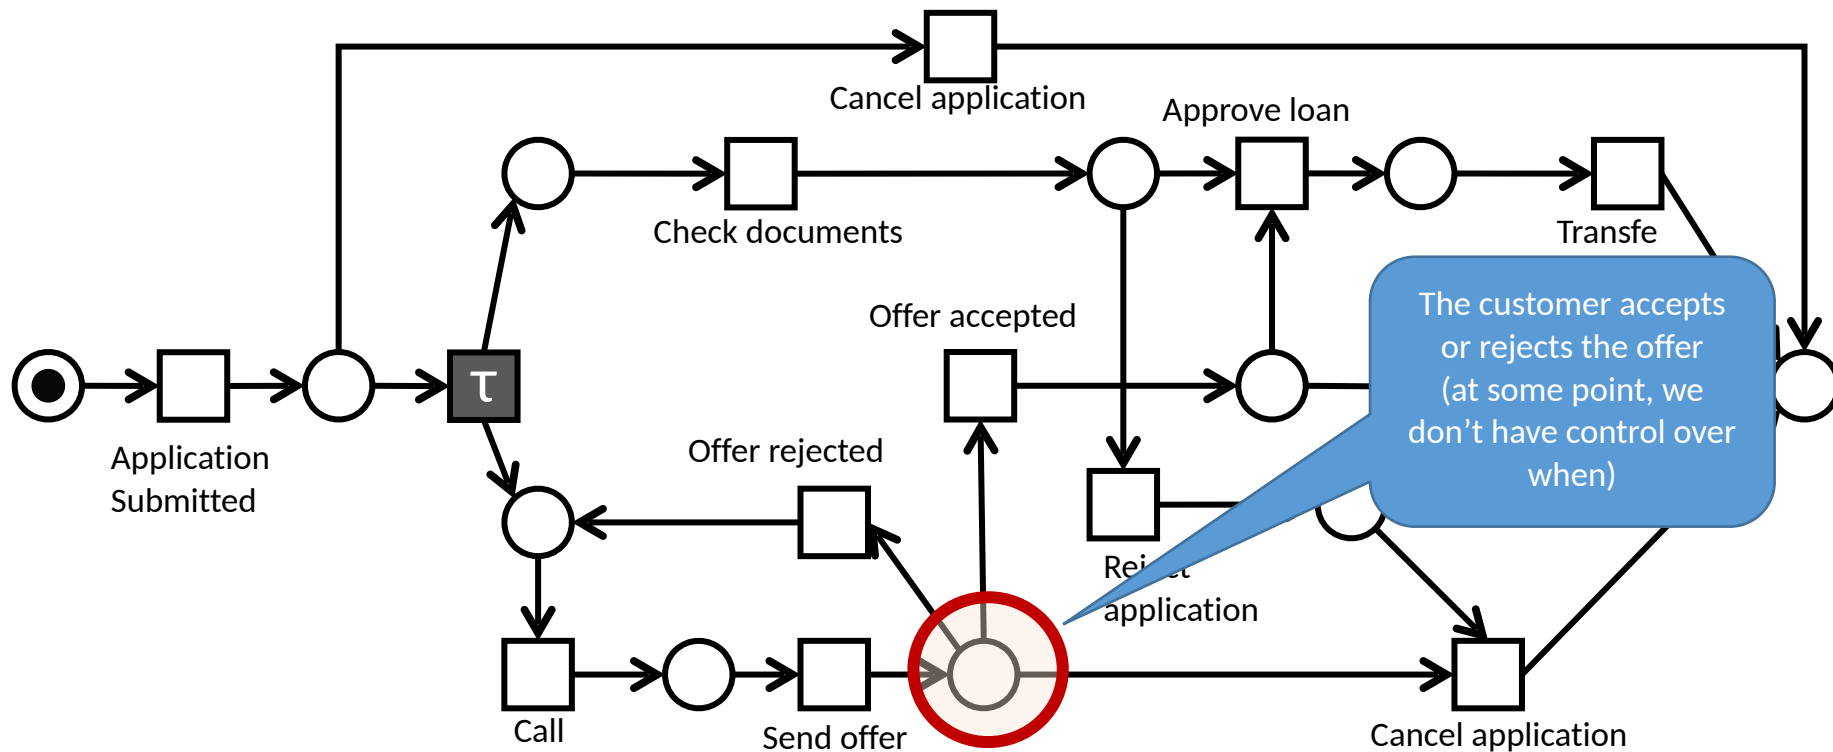

Connecting places imply causal dependencies

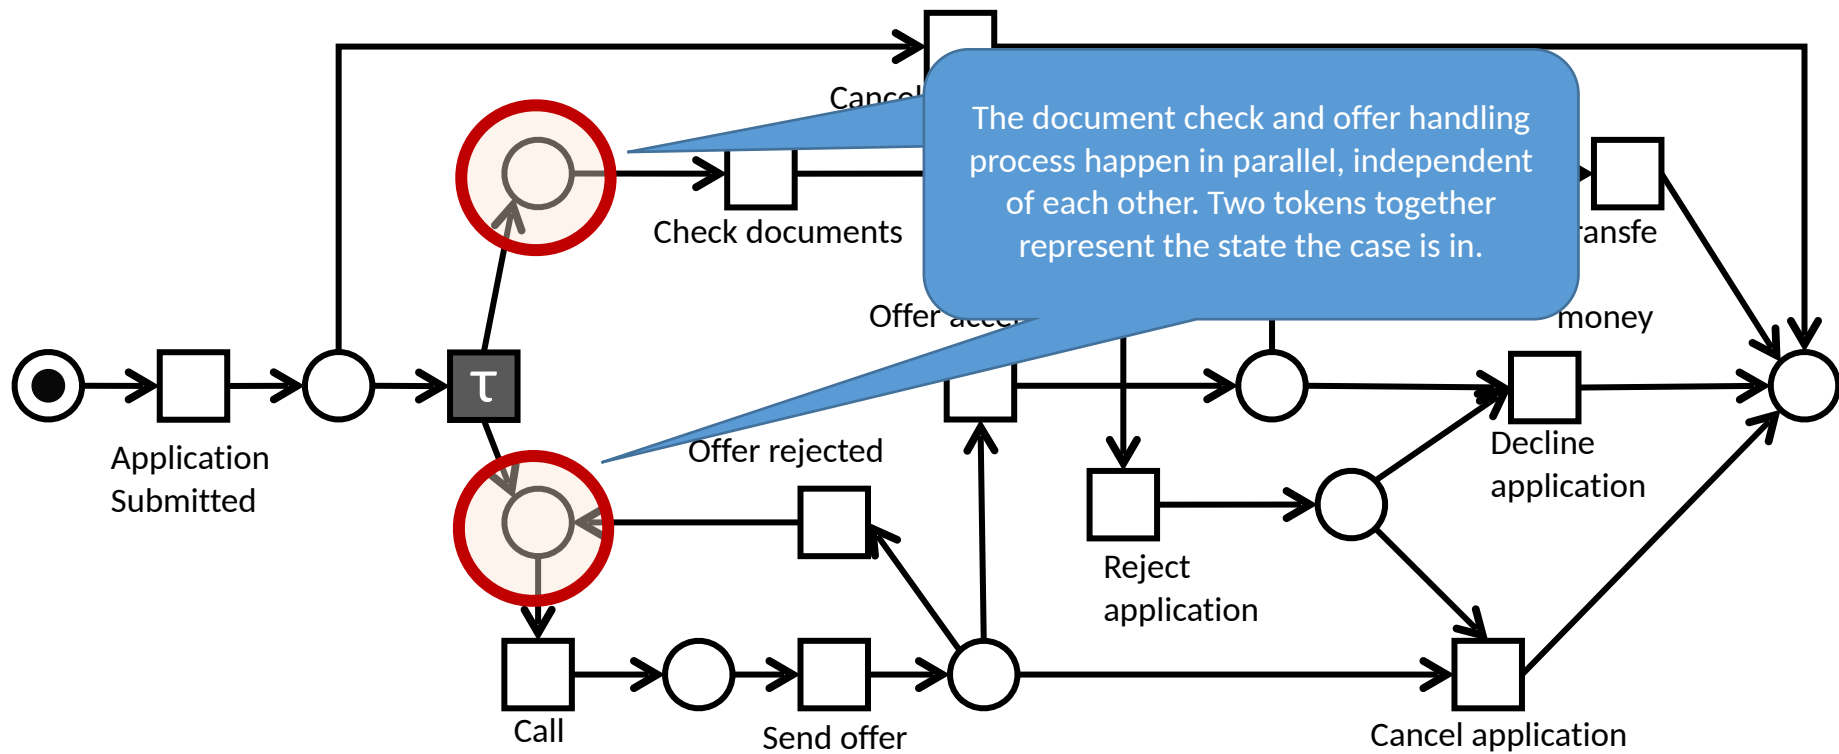

Explicit Choices (internal to the process)

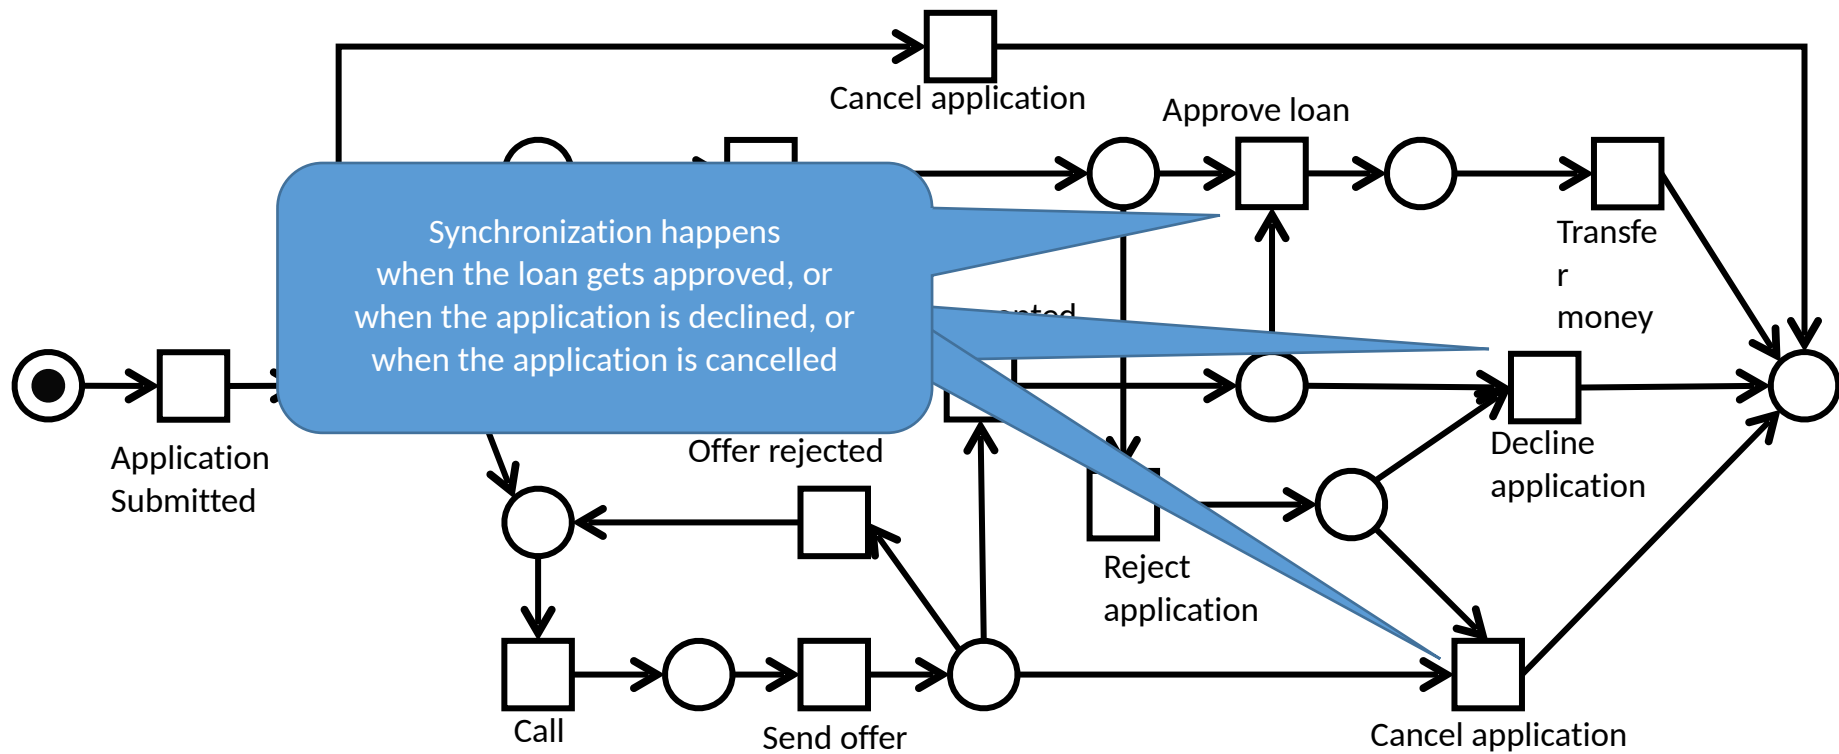

Implicit Choices (external to the process)

Paralellism

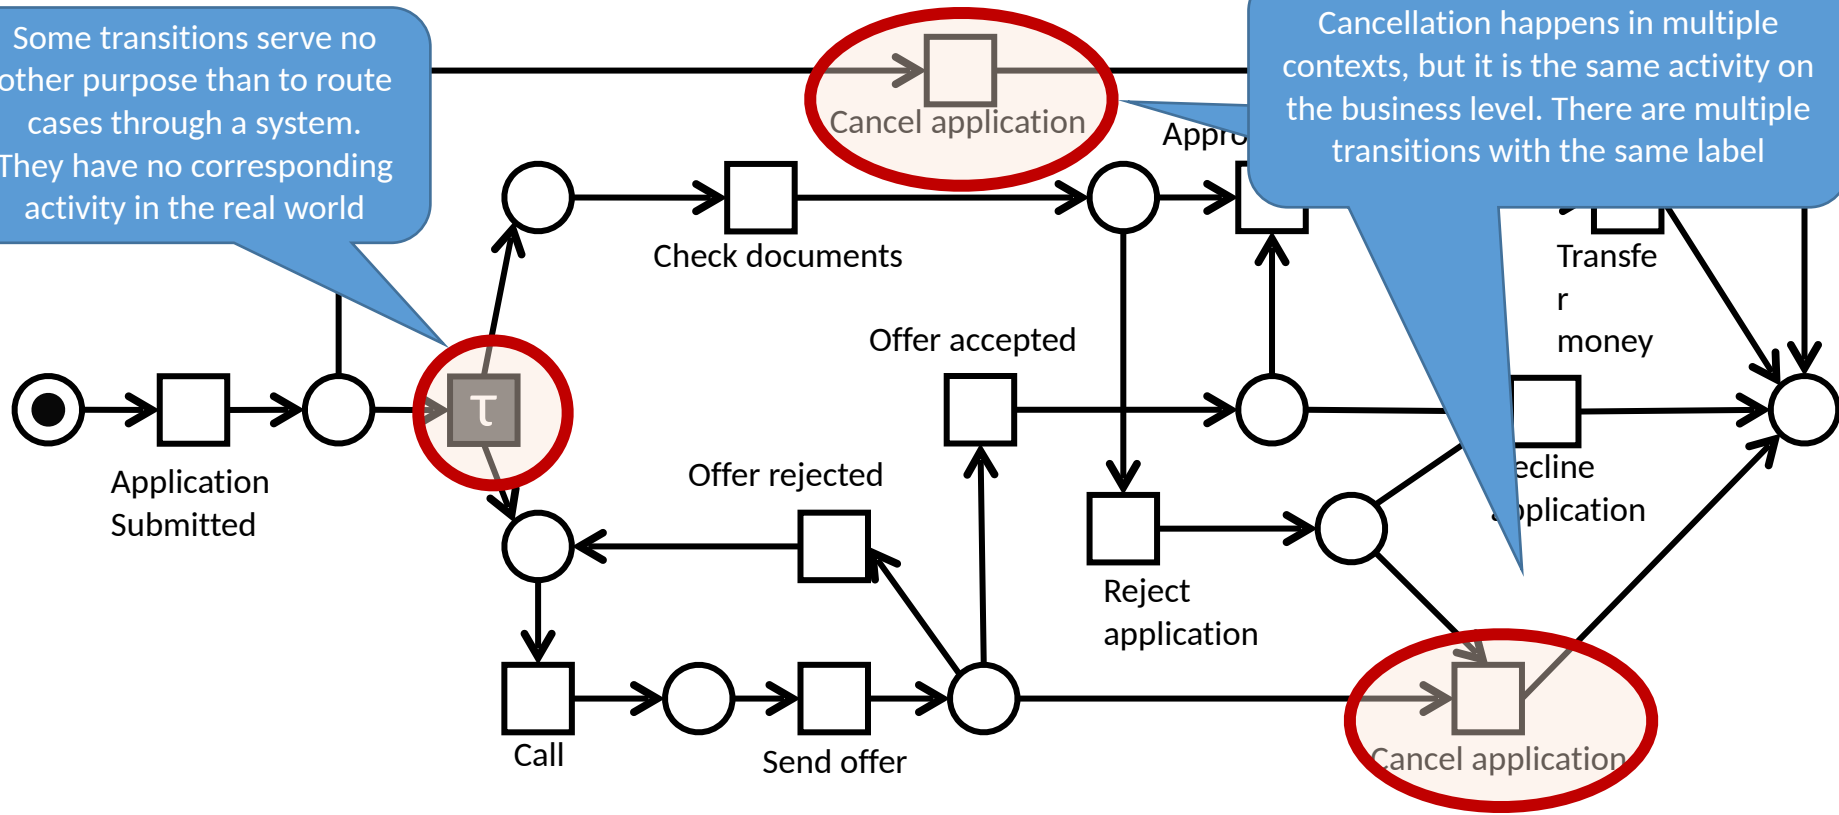

Paralellism

Duplicate labels / 'routing' transitions

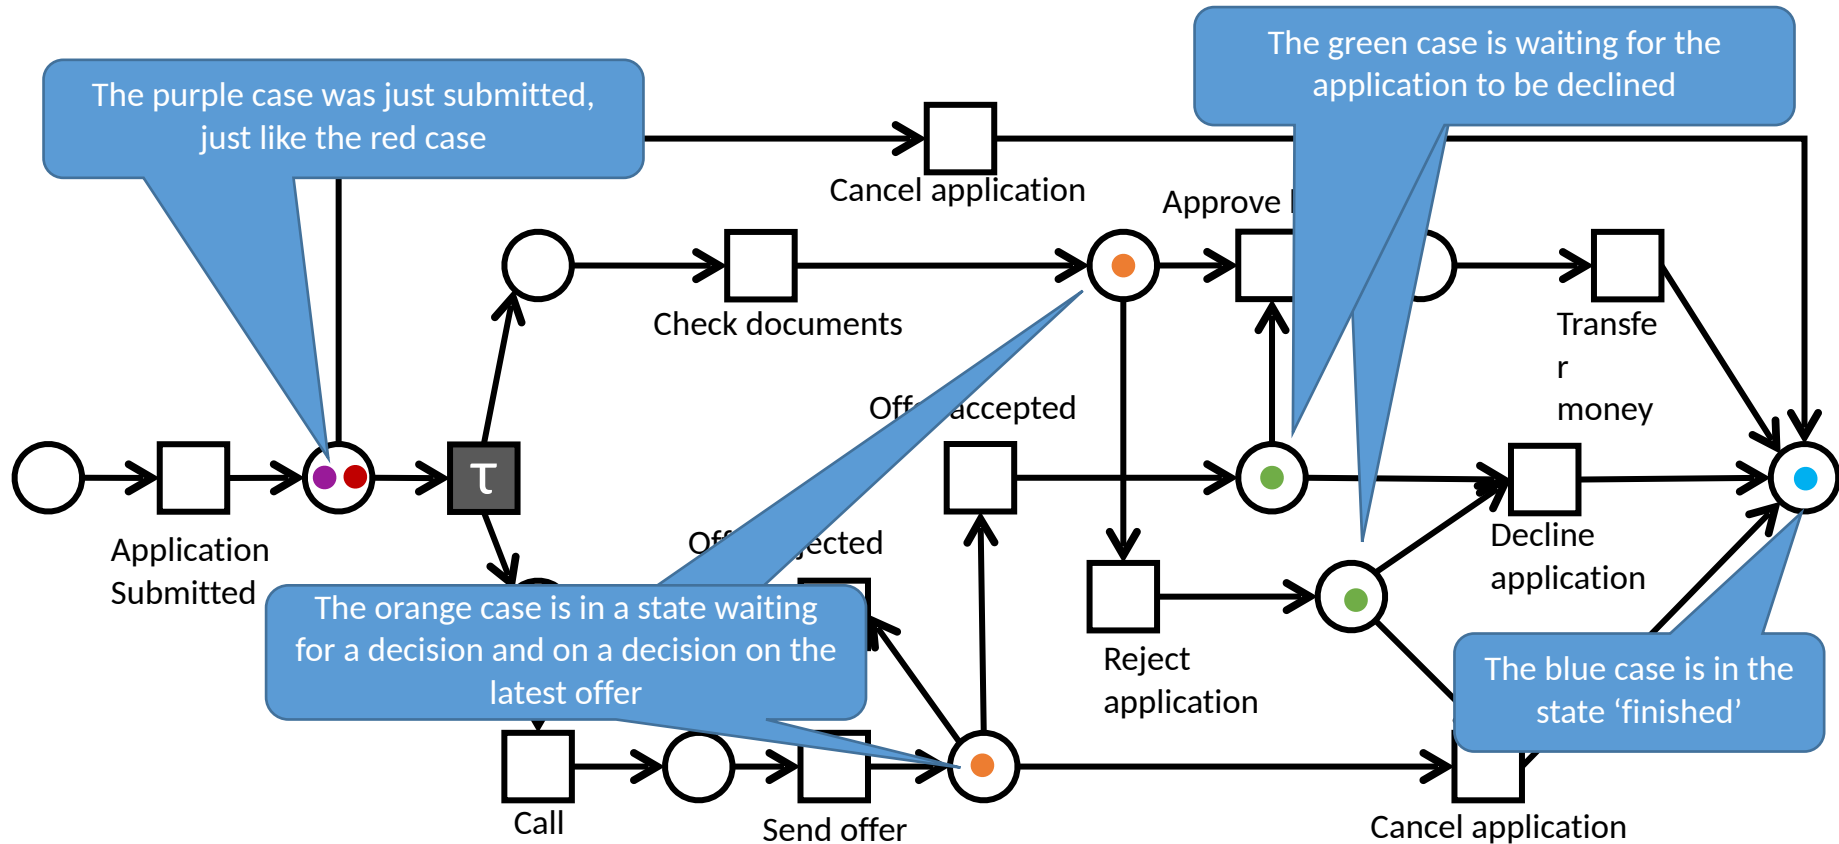

Some transitions serve no other purpose than to route cases through a system. They have no corresponding activity in the real world

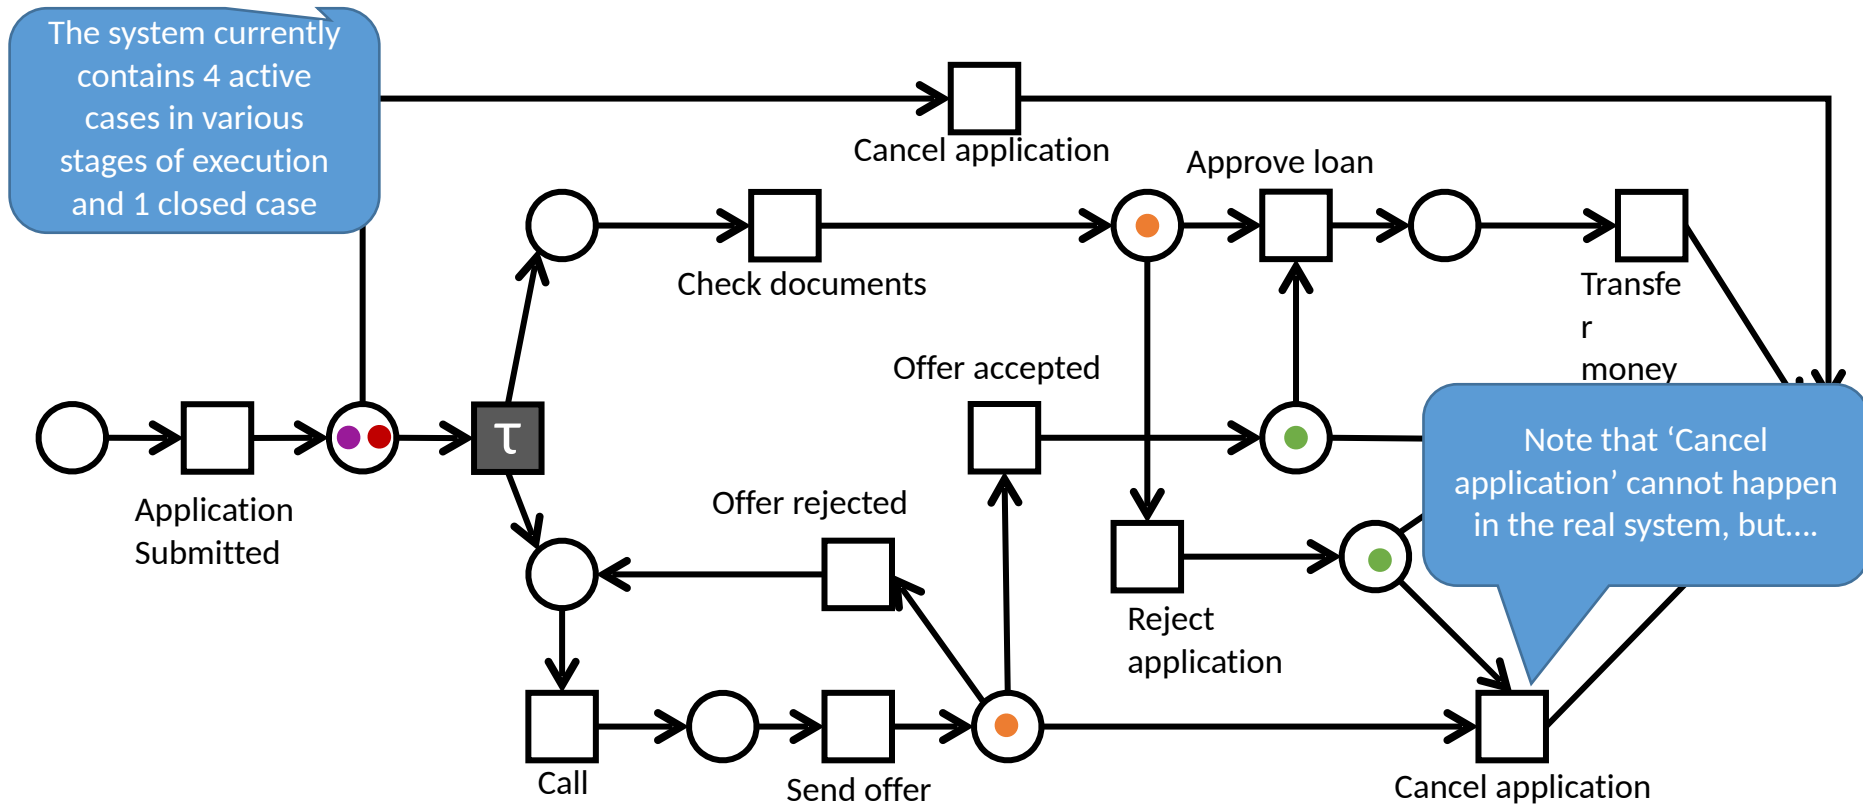

System models vs. Process models

- When Petri nets are used to model systems, the marking denotes the state of the system.
- When Petri nets are used to model processes, the marking typically denotes the state of an individual case (and only markings are considered that can be reached from the initial marking with a single token in the initial place)

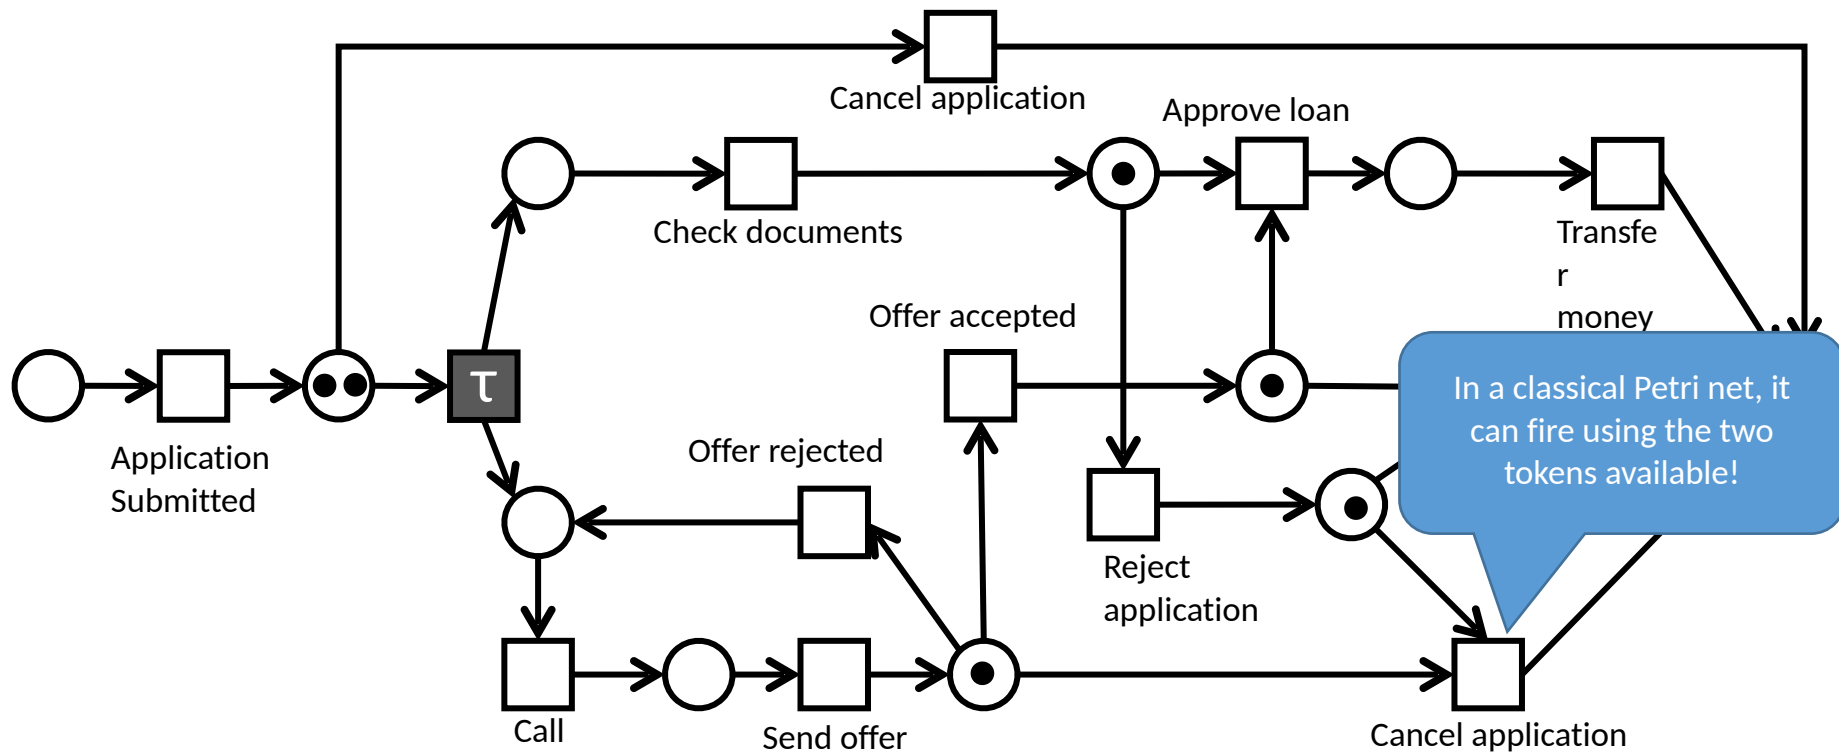

State of a case vs. State of a system

State of a case vs. State of a system

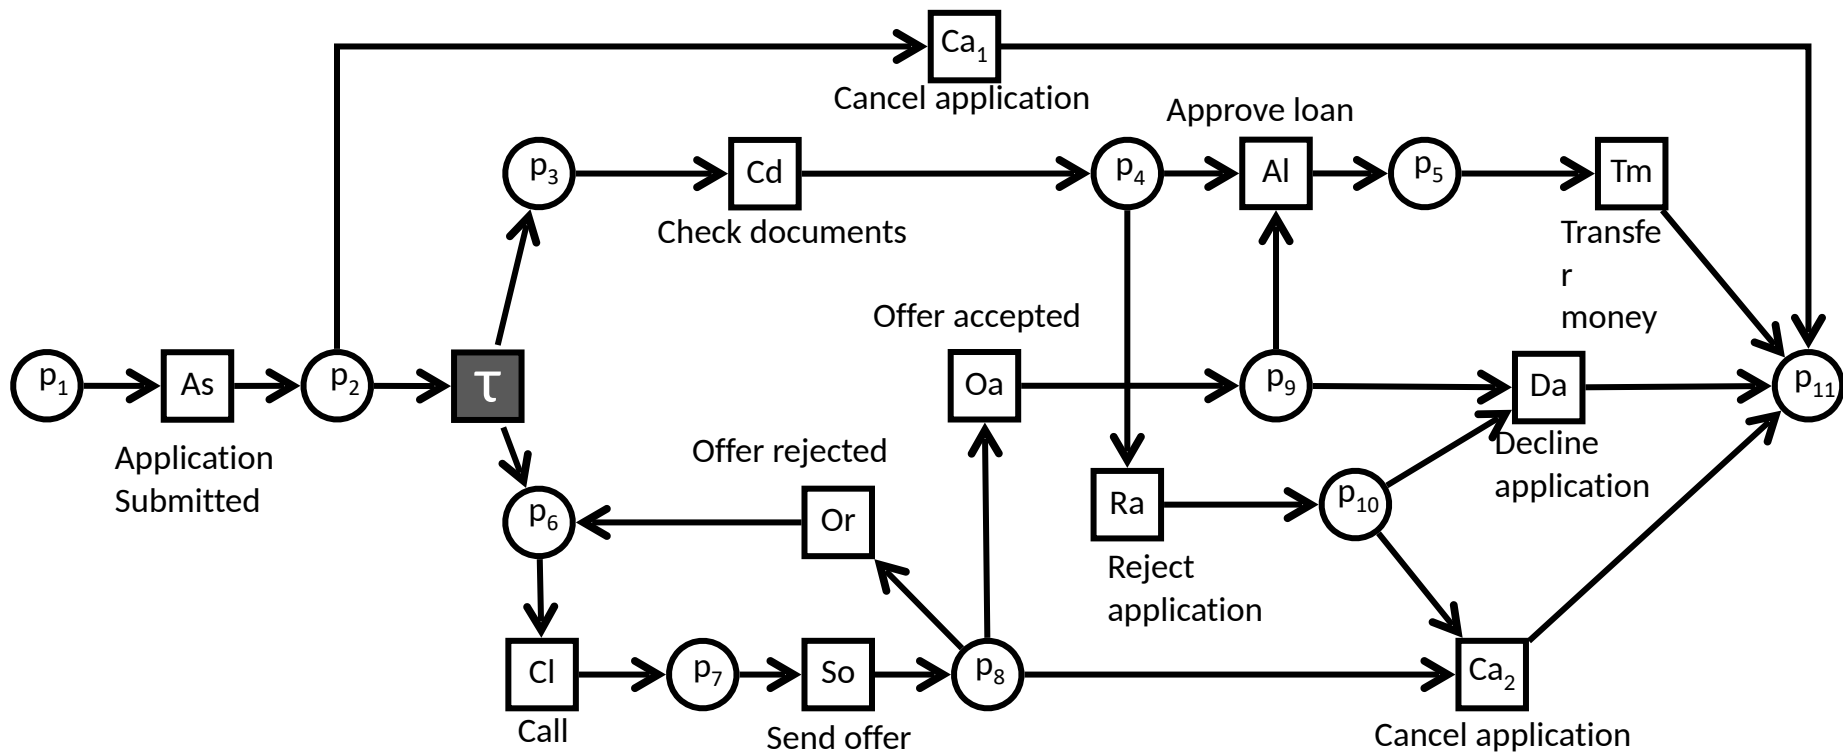

State of a case vs. State of a system

State Space of a Petri Net

- Start from the initial marking
- Fire transitions and note down all new markings
- Do the same for all markings until all have been investigated

State Space of a Petri Net: Label the sequences!

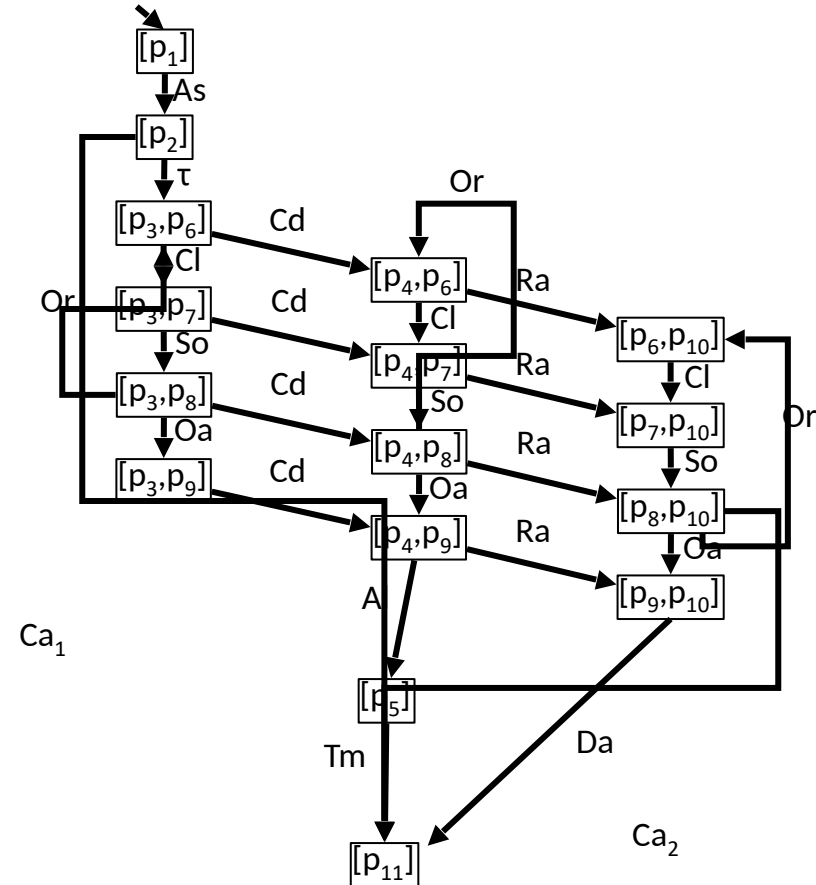

State Space of a Petri Net

- Start from the initial marking
- Fire transitions and note down all new markings
- Do the same for all markings until all have been investigated

Statespace (transition system or marking graph) of the Petri net for simplified BP12 example

Do you understand this process?

Petri nets are the mathematics
of process science /
process analytics

Take Away

Petri nets are a graphical notation supported by a sound mathematical ground

They naturally are able to describe systems and in particular, processes

Tool support at different levels
